ACKNOWLEDGEMENTS

The authors would like to thank the following people for their direct involvement with planning, reviewing, and contributing to the Community Wildfire Resiliency Plan (CWRP) for the Regional District of Central Kootenay Electoral Area C. These individuals invested their time in meetings, answering questions, or reviewing and commenting on the contents of this document.

Adriana Burton	Wildfire Prevention Specialist	BCWS
Mike Allan	Wildfire Tech	BCWS
Asa Maclaurin	Wildfire Tech	BCWS
Jared Riel	Fire Chief	West Creston
Marc-Andre Beaucher	Manager	Creston Valley Wildlife Management Area
Amber Cooke	Land and Resource Coordinator	Ministry of Forests
	Disaster Mitigation and Adaptation Senior Advisor	RDCK
Nora Hannon		

This report would not be possible without the Community Resiliency Investment Program and funding from the Union of British Columbia Municipalities.

EXECUTIVE SUMMARY

In October 2024, B.A. Blackwell and Associates Ltd. was approached by the Regional District of Central Kootenay (RDCK) to assist with updating their existing 2017 Community Wildfire Protection Plan (CWPP) for Electoral Area C to the newest Community Wildfire Resiliency Plan (CWRP) format. A CWRP is both a localized risk assessment and an action plan to improve wildfire resiliency within Electoral Area C's Wildland-Urban Interface (WUI). This update accounts for changes that have occurred since the development of the last plan, and takes advantage of the newest community wildfire planning framework in BC. The CWRP has a strong focus on the [seven FireSmart™ disciplines](#)¹ and on interagency collaboration.

The Area of Interest (AOI) of this CWRP encompasses the 1-km Wildland Urban Interface (WUI) of much of the Creston Valley, including the communities of Duck Lake, Lakeview, West Creston and Goat River Bottom. Recommendations made within this plan are directed at the RDCK, although some recommendations involve collaboration or partnership with other local governments, agencies, or organizations.

The RDCK has a mature and successful regional FireSmart program. In addition to identifying areas of possible expansion and improvement, this plan serves to recognize all the progress made to date since the last CWPP was completed. Across the RDCK between 2018 and 2023, 1699 FireSmart Home Assessments have been completed, 29 neighbourhoods have received FireSmart recognition, \$96,000 of mitigation work has been completed under a FireSmart rebate program, and \$77,738 of Neighbourhood Champion grants has been distributed.² Specifically in Electoral Area C, there have been 33 FireSmart Assessments and 7 rebates awarded. These participation numbers are low compared to neighbouring Electoral Areas, indicating that further public education in the plan area may be beneficial (Item # X). Two areas of possible improvement are with regards to promoting resiliency of agricultural areas (Action Item #6) and with the FireSmart Canada Neighbourhood Recognition Program (Item #32) – no neighbourhoods in Electoral Area C are recognized to date.

Since the last CWPP was completed for the area, the RDCK has also explored implementing a Wildfire Hazard Development Permit Area (DPA) policy. Although the RDCK has opted not to implement a Wildfire Hazard DPA in Electoral Area C at this time, development concerns have been partially addressed through the RDCK Bare Land FireSmart assessment program, offered throughout the region to residents who are planning to build on undeveloped lots. This free, voluntary assessment educates residents on FireSmart principles and advises best practices regarding construction, lot preparation, and landscaping.

The RDCK and its residents are well-versed in emergency preparedness and response. Flooding and wildfires frequently affect the Central Kootenays, and the 2024 wildfire season in particular had widespread impacts in the region, though outside of Electoral Area C. This CWRP recognizes the

¹ Education, Legislation and Planning, Development Considerations, Interagency Cooperation, Cross-training, Emergency Planning, and Vegetation Management

²Urban Systems. 2023. *Wildfire Development Permit Area Summary Report*.

importance of continuing a strong emergency management program, including tabletop exercises (Action Item #) and the importance of continuing interagency cooperation at both regional and subregional levels. Electoral Area C is represented both on the Creston Valley Community FireSmart Resiliency Committee, and on the Regional Wildfire Planning Table.

Communities in Electoral Area C are all in a provincially defined Wildland Urban Interface (WUI) Risk Class polygon that has a Risk Class of 2 (Creston) which reflects the second-highest wildfire risk rating. The Provincial Strategic Threat Analysis assigns a moderate or higher threat rating to much of the surrounding area. *As the scope of this plan was limited to that of an update, fieldwork focused only on verifying treatment units proposed in 2017, proposing additions or reductions to them, or creating new standalone treatment units, rather than updating fuel types and collecting wildfire threat assessments to support a local wildfire threat reassessment.*

The local threat assessment (completed in 2017 for the 2 km WUI and clipped to the 1 km Eligible WUI for this plan update) tells a consistent story – a portion of the assessable area has a high fire behaviour threat due to a combination of topography, fire weather, and fuel type. Although only 13% of the assessable area is classified as a high or extreme fire behaviour threat, local BCWS representatives noted that grassy areas throughout the Creston Valley, usually on private farmland, can pose a concern for rapid fire spread during seasonal dry periods. BCWS noted that open burning on fields in the Creston Valley is common in the springtime and there are few concerns with Wildfire Act compliance.

It is beyond the scope of the CWRP to analyze local threat on private land, which covers approximately 70% of the WUI. This highlights the need to implement risk mitigation programs on both public and private land if community resilience is to be achieved. Since the last CWPP, fuel treatments have been completed around Lakeview. However, there is more work to do throughout the plan area (Action Item #26). *Although detailed field reconnaissance was not in the scope of this plan update, 9 potential fuel treatment units (PTUs) on public land identified in the 2017 plan were visited and re-prioritized, clipping boundaries to the 1-km Eligible WUI where appropriate. These units should be seen as wildfire risk reduction (WRR) focus areas that will require further assessment by the appropriate land manager prior to prescription development, or may be best managed by a licensee with WRR as one objective.*

A total of 32 CWRP action items are presented in Table 1 below. Ultimately, these items should be considered as a toolbox of options to help increase the wildfire resiliency of communities in Electoral Area C. The RDCK will have to further prioritize implementation based on resources, strengths, constraints, and availability of funding, and regularly update the prioritization and course of actions over the lifetime of this plan.

Table 1: Regional District of Central Kootenay Electoral Area C - Community Wildfire Resiliency Plan Action Items

Item	Priority	Recommendation	Rationale	Lead	Timeframe	Metric for Success	Funding Source						
				(Involved)									
Education - Section 5.2													
Residents													
#1 FireSmart Staff	High	Continue to apply for funding to employ and train Wildfire Mitigation Specialists (WMS)/Local FireSmart Representatives (LFR) and a FireSmart Coordinator across the RDCK.	A FireSmart Coordinator is a fundamental component of a FireSmart program and a requirement for CRI funding. The CFRC noted that even with 6 WMS in the RDCK, there is sometimes a backup of requested home assessments, so hiring more WMS may be required as the program grows in popularity. But given the low number of assessments requested so far in Area C, lack of capacity is not currently a concern.	RDCK FireSmart	1 year and annually	Sufficient staff capacity is maintained to support the program	CRI FCFS for FireSmart staff						
#2 FireSmart Events	High	Continue to promote FireSmart to residents at community events (e.g. farmers markets) and through workshops using printed and digital FireSmart BC resources. Consider a FireSmart Community Preparedness Day or combined Emergency Preparedness Day. Include local first responders if possible.	Community events are a great opportunity to increase awareness of FireSmart programming and FireSmart BC resources present a unified message. Increased promotion in Area C may increase FireSmart program uptake.	RDCK FireSmart	1 year and annually	Continued uptake of the RDCK FireSmart program in Electoral Area C (e.g. number of home assessments completed)	CRI FCFS funding - FireSmart staff time; resources for Education events (banners, brochures, promo items)						
#3 FireSmart Advertising	High	Continue the RDCK FireSmart media campaign through social (i.e., Facebook, Twitter, Instagram), radio, and/or print media avenues. Keep track of which avenues receive the most engagement so that funds can be best directed and keep abreast of new outlets. Review material annually and update graphics and language to match any changes in the FireSmart BC program. Consider asking community associations to post on their websites or Facebook groups.	Successfully engaging a community in FireSmart will rely on more than one communication avenue. Keeping material 'fresh' and up to date is important for authoritative messaging. Increased promotion in Area C may increase FireSmart program uptake.	RDCK FireSmart	Annually	Funding is allocated each year to FireSmart communication in local/social media	CRI FCFS – FireSmart staff and costs						
#4 FireSmart in Schools	Moderate	Promote FireSmart in School District 8 schools (Creston) using the FireSmart Education Kit and other resources. Invite local first responders or forestry staff if possible.	Engaging local students in FireSmart may increase uptake with all residents. Also recommended in the 2023 Creston CWRP. There are no schools in Electoral Area C but students may live rurally.	RDCK FireSmart / Town of Creston/ School District 8	Annually	One FireSmart lesson delivered each year (minimum).	CRI FCFS						
#5 Home Assessments	High	Continue to offer and promote the free FireSmart Home Assessment and rebate program to residents.	FireSmart Home Assessments are a foundational part of FireSmart Education for a community and allow for in-person connection between residents and FireSmart staff. Rebate programs incentivize on-the-ground mitigation. The program has been popular to date.	RDCK FireSmart	Annually	The number of home assessments completed and rebates awarded increases annually	CRI FCFS						
#6 Farm and Ranch Preparedness	Moderate	Consider offering Farm and Ranch Wildfire Preparedness Workshop(s) in Electoral Area C and/or promoting the Farm & Ranch Wildfire Preparedness Guide & Workbook.	Small to medium size farms exist throughout the Creston Valley. Agricultural properties, especially with livestock, require special considerations during wildfire response and evacuation. Also an opportunity for education on open burning.	RDCK FireSmart / Emergency Management	2 years	One workshop is conducted Electoral Area C.	CRI FCFS – staff time and event costs						
Administrative													
#7 Share CWRP Online	Moderate	Like other CWPPs, make this plan available on the RDCK website and communicate its completion to residents.	Plan implementation will be most successful with buy-in from the public, as substantial action on private land is required.	RDCK FireSmart	1 year	Plan is available online	CRI FCFS – staff time						
#8 Annual Progress Report	Moderate	Consider releasing an annual RDCK FireSmart report to elected officials and the public that tracks community-specific uptake in various FireSmart initiatives	As the program grows, reporting allows the RDCK FireSmart program to track challenges and successes, further promote the program, and tailor outreach methods to achieve the most uptake.	RDCK FireSmart	Annual	An annual report is published.	CRI FCFS – staff time						

Item	Priority	Recommendation	Rationale	Lead	Timeframe	Metric for Success	Funding Source
				(Involved)			
#9 Update Website	Moderate	Coordinate FireSmart information on the RDCK website – a link to the RDCK FireSmart page should be provided on the Emergency Preparedness > Wildfires page in addition to where it is currently on the Fire Services > Fire Prevention page. Continue to update the webpage with the most recent FireSmart graphics and language.	FireSmart information should be easy to find online and be up to date (program names and graphics change frequently).	RDCK FireSmart	1 year and annually	Website is reviewed annually	CRI FCFS – staff time
Legislation, Planning and Development - Section 5.3							
#10 Critical Infrastructure	High	Continue to conduct FireSmart Critical Infrastructure Assessments for public works and community/government buildings. Conduct FireSmart mitigation as soon as possible (vegetation management, material upgrades). Encourage community hall societies and water providers to follow suit.	Protecting water systems and community infrastructure is critical to wildfire response and recovery. Assessments have not been completed for fire hall(s) (Creston Valley Fire Department).	RDCK FireSmart (Community Groups)	Ongoing	Number of assessments completed and mitigation hours/investment	CRI FCFS – publicly-owned only
#11 Bare Land Program	Moderate	Continue to offer the voluntary Bare Land FireSmart assessment program (for undeveloped land where residents are planning to build). Ensure that the program is promoted through the planning department as well.	The free bare land assessment by Wildfire Mitigation Specialist is an excellent educational tool to regulate construction and landscaping without a Wildfire Hazard DPA.	RDCK FireSmart (Planning/Development)	Ongoing	Number of assessments completed	CRI FCFS – staff time
#12 Review Wildfire DPA	Low	After the implementation of a Wildfire DPA in Electoral Area I (RDCK 'pilot), the RDCK should review its applicability in any part of Electoral Area C.	A Wildfire Hazard DPA remains a good tool to regulate development, and lessons learned from Area I may make for more buy-in / smoother roll out in other areas. Certain parts of Area C have small lots and dense development that could make a DPA practical (Goat River Bottom).	RDCK FireSmart (Planning/Development)	3 years	A Wildfire DPA in Electoral Area C is reconsidered prior to the next CWRP	CRI FCFS – staff time
#13 Schedule CWRP Updates	High	Schedule regular updates of this Community Wildfire Resiliency Plan: target every 5 years. Apply for enough funding so that the Eligible WUI can be reassessed.	A current and acceptable CWRP is required for funding under the CRI FCFS program. Even if this plan is 'updated' (<5 years old), the budget should reflect the large plan area and the need for field work and spatial analysis throughout the Eligible WUI.	RDCK FireSmart (Consultant)	5 years	Area C maintains a current and acceptable CWRP.	CRI FCFS funding
Cross Training & Fire Department Resources - Section 5.4							
Training							
#14 Fire Department Training	Low	Support Creston Fire Rescue in maintaining their current level of training, and consider additional courses offered by BCWS as the need arises (e.g. Engine Boss, Task Force Leader).	SPP-WFF-1 is specific for structural fire fighters who respond to wildland fires in their service area. Creston Fire Rescue indicated that all members currently receive SPP-WFF-1 and SPP-115. The RDCK may be able to help organize the provision of higher-level courses in the region.	RDCK (Creston Fire Rescue)	Annually	All local firefighters are trained in SPP-WFF1 and WSPP-115, and refresh the course annually	Compensation for course instructor/facilitation of spring training courses; CRI FCFS funding
#16 FireSmart Training	Low	Consider encouraging FireSmart specific training within Creston Fire Rescue: FireSmart 101, Local FireSmart Representative (LFR), and Wildfire Mitigation Specialists. This may be encompassed by the Advanced FireSmart Program for RDCK fire chiefs and fire services staff started in 2023.	Fire department members are often also community leaders and members of Creston Fire may live in rural Area C. FireSmart training can help achieve public education objectives, coordinate messaging across a fire department, and expand the reach of a FireSmart program, especially if additional local WMS are needed (see Item #1).	RDCK (Creston Fire Rescue)	Annually	Target 1 WMS specific to Area C	CRI FCFS funding
#17 Cross Training	Low	Look for ways to support Creston Fire in holding annual practical training with wildland fire equipment, including structural protection scenarios. Include BCWS and RDCK crews if possible.	Practical training is essential for fire departments, and BCWS cross-training enhances the abilities of crews to work together on an interface fire. Creston Fire indicated that they already have a good working relationship with BCWS.	RDCK (Creston Fire Rescue) (BCWS)	Annually	All fire department members participate in a practical training event annually	Staff and volunteer time
Water / Other							

Item	Priority	Recommendation	Rationale	Lead	Timeframe	Metric for Success	Funding Source
				(Involved)			
#18 Response Map	Moderate	Encourage Creston Fire Rescue to contribute information to a RDCK dataset of natural and artificial water sources and access points for fire suppression. Share this information with BCWS, all mutual aid fire response partners, and update over time. Include with other key fire response information, like roads, trails, and gates, on a map.	Water sources in the plan area are known by firefighters but are not mapped. In an interface wildfire scenario it would be helpful if this information, including notes on access and seasonal reliability was digital (e.g. KMZ) so it could be easily shared with BCWS response personnel and mutual aid partners, as well as included in the pre-planning of emergency community water delivery systems.	RDCK (Creston Fire)	2 years and ongoing	A digital file or PDF response map is produced and shared	Incremental staff time; funding possible
#19 Water Supply Analysis	Moderate	Assist Creston Fire Rescue in identifying and implementation possible mitigation solutions for water supply issues in Electoral Area C.	Creston Fire Rescue expressed concerns with the reliability of water sources in the fire service area, including with standpipe maintenance, and expressed the need to identify designated drafting sites.	RDCK (Creston Fire)	3 years and ongoing	Adequacy of water supply for fire suppression is reviewed	Incremental staff time; funding possible
Interagency Cooperation - Section 5.5							
#20 FireSmart Committee	High	Continue to engage with the established Creston Valley FireSmart and Resiliency Committee (CFRC) and regional Wildfire Planning Table to plan, implement, and coordinate FireSmart initiatives, including fuel management treatments.	Both regional and sub-regional FireSmart Committees are valuable. The current regional Planning Table and Creston Valley CFRC are effective tools for interagency cooperation in the region.	RDCK FireSmart	Ongoing	CFRC FireSmart meeting takes place at least annually.	At least 8 hours per meeting to prepare, participate and debrief. CRI FCFS
Emergency Planning - Section 5.6							
#21 Tabletop Exercises	Moderate	As part of the RDCK Emergency Program, continue to hold annual tabletop emergency exercises with emergency management partners.	Tabletop exercises provide an opportunity to identify weak spots in a plan and collaborate. West Creston is probably the best place in Area C to simulate an interface fire.	RDCK Emergency Management (RCMP; BCWS; Fire Departments)	2 years	Exercise involving an interface fire is completed every few years	CRI FCFS Emergency Planning. Possibly CEPF / Columbia Basin Trust
#22 Voyent Alert	High	RDCK should continue to promote the Voyent Alert! System to residents and visitors.	Clear, consistent, concise, and quick communication during an emergency event and evacuation are integral to the prevention of loss of life. This was identified as an issue during WUI fire disasters in Lahaina, Maui, USA and Fort McMurray, Alberta.	RDCK Emergency Management	Ongoing	Continued uptake of the Voyent Alert! System (can track downloads from app providers).	RDCK staff time
#23 Secondary Power Sources	High	Purchase or encourage the purchase of back-up generators for any publicly or society-owned critical infrastructure that does not have one yet.	Back-up generators for pumphouses, treatment plants, and community buildings (especially those designated as emergency shelters) would facilitate both emergency response (water supply for suppression) and rapid community return and recovery following a fire.	RDCK Emergency Management (Town of Creston)	2 years	Fire halls and water systems have back up power	Staff time and equipment cost
#24 Pre-incident Plan	Moderate	The RDCK should consider requesting one or more Structure Protection Community Assessments through the BCWS Provincial Structure Protection Coordination office.	Intermix communities in the plan area e.g. West Creston may be good candidates for a Structure Protection Community Assessment due to reliance on natural water sources and single access-egress	RDCK (BCWS) (OFC) (Creston Fire)	5 years	A Structure Protection Community Assessment is completed	Can be requested through the Structure Protection Coordination office. There may also be funding through the Fire Chief's Association of BC or the Office of the Fire Commissioner
#25 Promote Good Civic Addressing	Moderate	Continue to promote the installation of visible and reflective addresses throughout Electoral Area C. Consider including a link to purchase recommended signage on the RDCK Emergency Management webpage.	The CFRC noted that address visibility was poor. Reflective signs help emergency responders find properties during response or evacuation events. Consider selling signs as a fire department fundraiser (e.g. Riondel VFD in Area A) and/or offering free delivery and installation along with a FireSmart Home Assessment.	RDCK FireSmart (Creston Fire)	2 years	Most properties have visible addresses	Promotion campaign; consider selling signs as a fundraiser
Vegetation Management - Section 5.7							

Item	Priority	Recommendation	Rationale	Lead	Timeframe	Metric for Success	Funding Source
				(Involved)			
Fuel Management Treatments							
#26 Fuel Management on Public Land	Moderate	Work with land manager(s) to have existing fuel treatment units maintained as necessary and to recce, prescribe, and implement additional Potential Fuel Treatment Units (PTUs), starting with those identified as High priority.	Some strategic areas of Crown land have already been implemented. Monitoring (as part of the next CWRP update) and maintenance should be conducted as necessary and additional areas treated. BCWS supports Crown land treatments around communities in the area.	Ministry of Forests (RDCK)	5 years	Previously treated areas are maintained in a lower hazard state and additional treatments are completed.	CRI (FCFS, WRR) or CBT
#27 Pilot Map	Moderate	Annually update and look for ways to improve the pilot mapping tool that was recently developed by the Regional Wildfire Planning Table to consolidate and track fuel treatments.	A regional fuel treatment dashboard is a valuable tool that integrates information on fuel treatments across multiple funding agencies in a user-friendly format.	RDCK / Planning Table	Annual	A useful regional fuel treatment dashboard is maintained.	Funding may be available.
#28 Fuel Treatment on Private Land	Moderate	Engage with the Ministry of Forests to discuss a strategy to enable owners of large, forested properties to undertake meaningfully-sized fuel treatments. A strategy could involve education, free guidance and potentially an incentive program. Look to Washington State Department of Natural Resources' Small Forest Landowner Regulation Assistance Program for a possible framework.	Even the most dedicated residents will likely have difficulty (time, cost) undertaking fuel treatments beyond the 30 m Home Ignition Zone. However, effectively reducing wildfire risk from structures-out will involve forest treatments on private land on a broad scale. Residents may benefit from a program that helps them plan and undertake such treatments in compliance with local and provincial legislation, and in a cost-effective and possibly income generating manner.	RDCK (Ministry of Forests)	4 years	Meetings take place	Incremental staff hours; possibly part of ongoing interagency communications
#29 Interpretive Signage	Moderate	As part of fuel treatment implementation, the RDCK should develop interpretive signage to demonstrate pre- and post-fuel treatment forest stands conditions.	Many areas have been treated since the 2008 CWPP and the intent may not be known to all residents. Interpretive signage could include text explaining the purpose of the fuel management treatment, connection to the current CWRP, and FireSmart practices residents nearby can take to reduce wildfire hazards around their yards and homes.	RDCK FireSmart	5 years	Signage installed during implementation phases.	CRI FCFS
Residential and Community FireSmart							
#30 Contractors List	Moderate	Continue to provide a FireSmart Contractors list on the RDCK FireSmart website and offer the RDCK FireSmart Contractors Info Session for applicants.	Connecting residents with contractors who are qualified to complete FireSmart mitigation work (contractors for the home, landscapers, or arborists and forest fuel mitigation) removes a barrier to mitigation action.	RDCK FireSmart	Ongoing	A useful list of qualified contractors is provided online	CRI FCFS- FireSmart staff
#31 Free Yard Waste Disposal	Moderate	Continue to offer regional district-led options for the disposal of yard waste. Currently, this includes having tipping fees waived (April and October) for yard waste at the Creston landfill.	Having to pay tipping fees may be a barrier for residents who wish to conduct FireSmart landscaping, especially during the fire season when burn bans are in place.	RDCK FireSmart	Annual	Free yard waste disposal continues	CRI FCFS funding is available for tipping fee coverage
#32 Neighbourhood Recognition	High	Continue to promote the FireSmart Canada Neighbourhood Recognition Program, including offering support from local Wildfire Mitigation Specialist(s) or Local FireSmart Representatives (LFRs) for Neighbourhood Assessments, Plans and Clean Up Days. Continue offering the Neighborhood Champion Grant.	The RDCK provides step-by-step information online for interested neighbourhoods. Electoral Area C has no recognized neighbourhoods to date. The Neighborhood Champion Grant provides a valuable incentive for program participation and has received good uptake in other Electoral Areas.	RDCK FireSmart	2 years	A neighbourhood in Area C receives recognition.	CRI FCFS- FireSmart staff; FireSmart Champion Grant

SECTION 1: INTRODUCTION

In October 2024, B.A. Blackwell and Associates Ltd. was retained by the Regional District Central Kootenay (RDCK) to update the previous 2017 RDCK CWPP for Electoral Area C to the Community Wildfire Resiliency Plan (CWRP) template. This plan replaces the previous 2017 RDCK CWPP for Electoral Area C. A CWRP has its roots in the Community Wildfire Protection Plan (CWPP) framework, which was originally established in BC in response to the series of devastating wildfires in 2003. Since then, many communities in BC have continued to face an ever-increasing threat of wildfire, as the 2017, 2018, and 2023 fire seasons proved to be three of the most historically damaging seasons on record.

CWRPs are currently being developed at many jurisdictional and geographic scales and are individually tailored to address the needs of different communities in response to their size, their capacity, and the unique threats that they face. Despite these differences, the goals of a CWRP remain the same and are founded in the seven FireSmart disciplines: Education, Legislation & Planning, Development Considerations, Interagency Cooperation, Cross-Training, Emergency Planning and Vegetation Management.

CWRPs are funded in BC by the Union of BC Municipalities (UBCM) under the Community Resiliency Investment (CRI) FireSmart Community Funding and Supports (FCFS) Program. As per funding requirements, this CWRP is completed according to the 2023 CRI template.

1.1 PLAN PURPOSE AND GOALS

This plan accounts for FireSmart program changes that have occurred since the 2017 CWPP and takes advantage of the most recent community wildfire planning framework in BC. This CWRP:

- Re-identifies the interface wildfire risk around communities by clipping the 2017 CWPP wildfire threat layer (completed to a 2-km WUI) to the newer 1-km Eligible WUI,
- Re-identifies the interface fuel types around communities by clipping the 2017 CWPP fuel type layer (completed to a 2-km WUI) to the newer 1-km Eligible WUI,
- Re-visits fuel treatment units proposed in 2017, proposing additions or reductions to them,
- Proposes new fuel treatment units, and
- Updates RDCK's FireSmart program for Electoral Area C.

This CWRP is intended to serve as a framework to guide the implementation of specific actions and strategies to:

- 1) Increase the efficacy of fire suppression and safety of emergency responders,
- 2) Reduce potential impacts and losses to property and critical infrastructure from wildfire, and
- 3) Reduce potential wildfire behavior and threat within the community.

To help guide and accomplish the above strategies, this CWRP will provide the RDCK with:

- 1) An assessment of values at risk and potential consequences from wildfire,
- 2) Maps of fuel types and recommended areas for fuel treatments (2017 fuel types and revised or additional fuel treatment areas),
- 3) An assessment of emergency response capacity, and
- 4) Options and strategies to reduce wildfire risk through the seven FireSmart disciplines.

1.2 PLAN DEVELOPMENT SUMMARY

The CWRP development process consisted of five general phases:

- 1) Formation of the plan-level Community FireSmart Resiliency Committee. Consultation with the CFRC and information sharing occurred throughout.
- 2) Review of relevant plans and legislation regarding emergency response and wildfire (Section 2)
- 3) Description of the community and identification of values at risk (Section 3)
- 4) Assessment of the local wildfire risk (Section 4)
- 5) Analysis and action plan for each of the seven FireSmart disciplines (Section 5)

SECTION 2: RELATIONSHIP TO OTHER PLANS AND LEGISLATION

Wildfires can affect all aspects of a community. As a result, numerous RDCK plans, and neighboring jurisdictions relate to this CWRP. This section reviews all relevant plans, policies, bylaws, guidelines and provincial legislation to identify sections within that are relevant to community wildfire planning and response.

2.1 LOCAL AUTHORITY EMERGENCY PLAN

Emergency preparedness and response planning in BC is guided by the Emergency and Disaster Management Act (EDMA), which replaced the Emergency Program Act in November 2023.³ This Act defines the various roles and administrative duties of the province and local governments regarding the implementation of higher-level emergency planning; the processes of declaring a state of emergency; and the coordination of post-disaster relief. The Act emphasizes the four phases of emergency management: mitigation, preparation, response, and recovery.

Emergency planning in Electoral Area C is provided under the RDCK Emergency Management Program. The RDCK Emergency Management Program encompasses all 11 Electoral Areas in the RDCK as well as the participating municipalities of Kaslo, Nakusp, New Denver, Salmo, Slocan and Silverton. The RDCK Emergency Response and Recovery Plan (2015)⁴ outlines structural and organizational requirements for

³ More information can be found at [Modernized emergency management legislation - Province of British Columbia \(gov.bc.ca\)](https://gov.bc.ca/)

⁴https://rdck.ca/wp-content/uploads/2024/11/2015-04-31_RDCK_Emergency_Response_Recovery_Plan%20V22.pdf

coordinated response and recovery from emergencies in the RDCK, including decision-making tools for evacuation or shelter in place; emergency operation centers (EOC) levels and activation protocols; hazard and evacuation planning; fire planning including industrial, wildfire and structural fires; and recovery planning. Section 3.10 specifically deals with interface fires/wildfires, indicating that interface fires will be managed using unified command with the Ministry of Forests and local fire department(s) and other local fire departments, where applicable. The Plan is reviewed annually.

The RDCK Emergency Management Program conducts tabletop exercises yearly with staff (and responds to emergencies involving evacuations almost yearly). Emergency preparedness initiatives are further described in Section 5.6.

2.2 LINKAGES TO CWPPS/CWRPS

Regional District of Central Kootenay Area C Community Wildfire Protection Plan Update – 2017⁵

Beginning in 2017, B.A. Blackwell & Associates developed a Community Wildfire Protection Plan update for the Regional District of Central Kootenay Area C. The scope of this plan was a two-kilometer buffer around all residences and critical infrastructure based on structure density criteria. A tabularized review of the 2017 recommendations and their implementation status is presented in Appendix A.

Listed below are jurisdictions adjacent Electoral Area C that have been involved in community wildfire planning. *Strategic opportunities exist between these plans and should be considered.*

- *RDCK Electoral Area B CWRP 2024* – concurrently in development.⁶
- *RDCK Electoral Area A CWRP 2024* – concurrently in development.⁶
- *RDCK Electoral Area G CWRP 2024* – concurrently in development.⁶
- *RDCK Electoral Area D CWRP 2023* – recently completed.⁶
- *RDCK Electoral Area E CWRP 2023* – recently completed.⁶
- *Town of Creston CWRP 2023* – recently completed⁶
- *Yaqan Nukiy CWRP 2023* – recently completed⁶

2.3 LOCAL PLANS AND BYLAWS

The sections and policies of the Electoral C Comprehensive Land Use Bylaw No. 2317, 2013⁷ listed in Table 2 are directly relevant to proactive wildfire resilience in Electoral Area C. The OCP was reviewed as part of this CWRP to address any gaps or limitations that inadequately address fire hazards or risk mitigation. No gaps with OCP language as it related to wildfire risk reduction were identified (see also Section 5.3).

⁵<https://rdck.ca/wp-content/uploads/2024/11/Area%20C%20CWPP%202019.pdf>

⁶ By B.A. Blackwell & Associates Ltd and Cathro Consulting Ltd.

⁷ West Creston – Electoral Area C Comprehensive Land Use Bylaw No. 2317, 2013 (Consolidated to June 2024).

Table 2: Summary of Electoral Area C Official Community Plan and its relationship to this CWRP.

Section [Electoral C Comprehensive Land Use Bylaw No. 2317, 2013] ⁸	Relevant Policies
4.0 Residential	<p>General Residential Policies:</p> <p>5. <i>Will require that proposed residential development meet the following criteria, irrespective of land use designation:</i> <i>c. susceptibility to natural hazards including but not limited to flooding, slope instability or wildfire risk;</i></p>
6.0 Community Services and Administration	<p>Fire service is provided to portions of the Plan area through the Town of Creston and the Wynndel/Lakeview Volunteer Fire Department. Fire service is not available to other portions of the Plan area.</p> <p>6. <i>To ensure that land use decisions accommodate emergency response through provision of adequate access to developments and facilities for fire protection services and emergency first response.</i></p> <p>7. <i>To provide for an adequate level of fire protection and expansion of fire protection services to all areas within the Plan area.</i></p> <p>10. <i>Supports the location and development of fire halls, indoor recreation amenities, and community halls in the rural area as development requires and the needs of the community change.</i></p>
8.0 Infrastructure and Transportation	<p>Infrastructure Objectives</p> <p>5. <i>To support that new development be subject to the requirements of adequate water supply for both domestic and fire protection purposes.</i></p>

Section	Relevant Policies
<p>[Electoral C Comprehensive Land Use Bylaw No. 2317, 2013]⁸</p> <p>11.0 Hazard Lands and Fire Management</p>	<p>Fire Management Policies - The Regional Board:</p> <p>9. <i>May request that the Regional Subdivision Approving Authority require the developer to undertake a fire hazard risk assessment at the time of submitting a subdivision application where the Province indicates that a property may be subject to a moderate or high fire risk. The Regional Board may request the same assessment during a land use designation amendment or Development Permit process. The assessment will provide a recommended fire hazard mitigation strategy, that will be submitted to both the RDCK and the Province, and is recommended to include, but is not limited to the following:</i></p> <ul style="list-style-type: none"> <i>a. incorporating fuel breaks adjacent to or on the residential subdivision;</i> <i>b. establishing zones around potential structures and homes which are clear of debris, highly combustible material, or trees;</i> <i>c. utilizing fireproofing techniques and fireproof materials in building design, requiring at a minimum a fire rated roof;</i> <i>d. designing roads that provide evacuation routes and facilitate movement of fire fighting equipment;</i> <i>e. ensuring all roads are named and signed;</i> <i>f. ensuring availability of water supply facilities adequate for fire suppression;</i> <i>g. ensuring the provision of access to local water sources, lakes and watercourses as part of access requirements;</i> <i>h. implementing setbacks, interface fire protection standards, and building material standards pursuant to the Provincial publications The Home Owners Fire Smart Manual and Fire Smart: Protecting Your Community From Wildfire.</i> <p>10. <i>Directs the Regional Subdivision Approving Authority to require that where a fire hazard mitigation strategy has been prepared the developer enter into a restrictive covenant to ensure the strategy is followed.</i></p> <p>11. <i>Supports protection of accesses to water sources such as hydrants, standpipes, lakes, and streams to remain free of obstructions for fire protection purposes.</i></p> <p>12. <i>Encourages local volunteer fire departments to work with the RDCK to keep up to date with emergency preparedness and with the identification of increased risk as a result of natural or man-made events.</i></p> <p>13. <i>Encourages voluntary efforts to reduce fire risk to existing buildings and developments by residents and community members through educational materials and appropriate Fire Smart programs.</i></p> <p>14. <i>Supports the development and implementation of Interface Fire Management Plans and associated adjacent forest management strategies in areas of high to moderate wildfire risk.</i></p>

Section	Relevant Policies
[Electoral C	
Comprehensive Land	
Use Bylaw No. 2317,	
2013] ⁸	
13.0 Resource Area	<p>Resource Area Policies:</p> <p><i>13. Encourages forest managers to ensure that the rate of extraction of timber does not compromise the long-term productivity of the forest and that silviculture methods promote healthy forests and minimize fire hazards.</i></p>
14.0. Community Specific Policies	<p><i>3. Encourages investigation into community need and desire for the provision of local services, such as fire protection, retail and post office facilities.</i></p>

The local bylaws listed in Table 3 are directly relevant to proactive wildfire resilience in Electoral Area C. These bylaws were reviewed as part of the CWRP to address any gaps or limitations that inadequately address fire hazards or risk mitigation.

Table 3: Summary of local bylaws and their relationship to the CWRP.

Bylaws	Section	Description and Relation to CWRP
		Fire stopping components must be in place before insulation and exterior sheathing are installed.
Building Bylaw No. 2200 (2010)	18.4	<ul style="list-style-type: none"> - Addresses need for fire protection in new construction. - To mandate materials and landscaping beyond the BC Building Code and established bylaws, Development Permit Areas can be implemented (see Section 5.3)
Emergency Management Regulatory Use Bylaw No. 2210 (amended by Bylaw No. 2758 in 2021)	5.1	<p>Outlines administrative structure and roles of Emergency Program</p> <ul style="list-style-type: none"> - Provides structure and guidelines in times of emergency.
	Amended Bylaw No. 2758	<p>Adds “mitigation” into the description of the Emergency Program and Emergency Management Plan</p> <ul style="list-style-type: none"> - RDCK to develop, coordinate and manage emergency mitigation, preparedness, response, and recovery. This would include from wildfires.
Manufactured Home Parks Bylaw No. 1082 (1995)	8.8.3	<p>Fires shall be made only in stoves, incinerators, or other structures designed for that purpose.</p> <ul style="list-style-type: none"> - Limits fire ignition and propagation risks in structures made largely from ignitable and combustible materials.

Bylaws	Section	Description and <i>Relation to CWRP</i>
Parks Regulation – Consolidated Bylaw No. 2173	8.8.4	<p>If no approved fire hydrant is available to provide protection, a minimum of one (1) stagnant water supply at a minimum of 15,539 litres (6000 lgal) shall be provided on site in order to be accessed in case of emergency for fire protection purposes on properties serviced by Fire Protection.</p> <p><i>- Increases assurance of useful water supply systems in the event of a fire to responding fire departments.</i></p>
	22	<p>No person shall start or maintain a fire in a park, except in facilities provided at a park for that purpose.</p> <p><i>- Limits fire ignition and propagation risks.</i></p>
	24	<p>No person shall leave a fire in a park unattended.</p> <p><i>- Limits fire ignition and propagation risks.</i></p>
	25	<p>No person shall burn any unsuitable materials including but not limited to organic yard waste, household waste, plastic, rubber, flammable or combustible liquid, or any treated lumber or construction debris, or toxic waste.</p> <p><i>- Limits fire ignition and propagation risks.</i></p>
	52	<p>No person shall possess or discharge Fireworks, firecrackers or explosive materials of any kind in a park, except for an event authorized by a park use permit.</p> <p><i>- Limits fire ignition and propagation risks.</i></p>
	8 (15)	<p>No person other than the Site Operator or Service Personnel or their representative shall start any fires at any Resource Recovery Facility.</p> <p><i>- Limits fire ignition and propagation risks.</i></p>
Volunteer Fire Service Regulation Bylaw No. 2769	4.1	<p>Jurisdiction of each Fire Department, and the powers granted to each Fire Department and its Fire Chief and Members under this Bylaw, is restricted to the boundaries of the Fire Department's particular Fire Protection Service Area as set out in its establishment bylaw. A Fire Department shall not respond to any Incident under this Bylaw outside of the boundaries of its Fire Protection Service Area except as specified in Section 4(2)(a) to (f) of this Bylaw.</p> <p><i>- Outlines jurisdictional limits of fire departments, which may impact rural communities with no immediate fire service (see Section 5.6).</i></p>
	4.2	<p>Apparatus and Fire Department Equipment shall not be taken beyond the geographical limits of the jurisdiction for reasons other than repair, maintenance, or training unless: (a) a written agreement, approved by the Regional District, authorizes the supply of Members, Apparatus, Fire Department Equipment, Fire Protection Services and Associated Services to</p>

Bylaws	Section	Description and <i>Relation to CWRP</i>
		<p>another jurisdiction; or (b) under the authority of the CAO, the Regional Fire Chief, or the Emergency Operations Center Director; or (c) in connection with a request for assistance by a the Office of the Fire Commissioner, or a Federal or Provincial emergency response Agency; or (d) in connection with an Incident near the boundaries of the Fire Service Protection Area which, if left unattended, may threaten the Fire Service Protection Area or other such Service area; or (e) In the event of a Federal or Provincial State of Emergency; or (f) Under the provision of a bylaw for Associated Services.</p> <p>- <i>Outlines jurisdictional limits of fire departments, which may impact rural communities with no immediate fire service (see Section 5.6).</i></p>
	9.4	<p>No person shall grow shrubs, hedges, plants or trees to obstruct the visibility or use of a fire hydrant, standpipe or sprinkler connection.</p> <p>- <i>Provides linkage to FireSmart activities and property preparedness.</i></p>
	10.1	<p>Where this bylaw applies within a municipality the Regional District is authorized to enforce municipal open burning regulations.</p> <p>- <i>Limits fire ignition and propagation risks.</i></p>
	12.2	<p>The Occupier of a Public Building in which any of the Alarm System, Fire Protection Equipment, or emergency power system is not operating must institute and maintain a Fire Watch until those systems or equipment are operational.</p> <p>- <i>Limits fire ignition and propagation risks.</i></p>
Water Bylaw No. 2894	10.4.1	<p>All fire hydrants and standpipes directly connected to Regional District Water Mains are the property of the Regional District.</p> <p>- <i>Outlines RDCK ownership and responsibility relating to water sources.</i></p>
	11.6.2 (f)	<p>Notwithstanding the prohibitions in this Section, the Manager may authorize in writing the discharge of Regional District supplied water for the purposes of training programs for fire fighters.</p> <p>- <i>Supports training opportunities for local fire fighters</i></p>

2.4 HIGHER-LEVEL PLANS AND LEGISLATION

Table 4 lists higher-level plans and legislation that are relevant to wildfire planning and risk mitigation within Electoral Area C. These plans help guide where and how activities like resource extraction occur on the landscape, which can affect both wildfire threat and consequence. Depending on the location of any proposed fuel management treatments, fuel management prescriptions and prescribed / cultural burn

plans may need to address these plans as they relate to on-the-ground restrictions and policies for forest modification.

The Ministry of Forests (Selkirk Natural Resource District) indicated that a Wildfire Urban Interface Wildfire Risk Reduction (WUI WRR) Plan that will include the area around West Creston is scheduled for development in 2025-2026. WUI WRR plans are led by the Ministry of Forests Crown Land WRR program. They are the next generation of Tactical Plan and serve as the primary wildfire risk reduction planning mechanism for Crown land in the interface.⁹

Table 4: Higher level plans and legislation relevant to Electoral Area C's WUI and this Plan.

Plan/Legislation	Description and Relationship to CWRP
The Forest and Range Practices Act & Government Action Regulations (GARs)	<p>The Forest and Range Practices Act integrates wildfire considerations into forest management by mandating proactive planning, authorizing necessary fire control actions, and promoting collaboration with Indigenous communities to enhance forest resilience against wildfires.</p> <p>Multiple GARs overlap with the WUI. These include:</p> <ul style="list-style-type: none"> - <i>Non-legal Old Growth Management Areas</i> - <i>Ungulate Winter Range partial-harvest</i> - <i>Significant fish streams and rivers</i> - <i>Community watersheds</i> - <i>Regionally significant visual areas</i>
BC Provincial Open Burning Smoke Control Regulation	<p>The Open Burning Smoke Control Regulation came into effect in September 2019 and governs open burning relating to land clearing, forestry operations and silviculture, wildlife habitat enhancement, and community wildfire risk reduction.</p> <p><i>The wildland-urban interface is within a High Smoke Sensitivity Zone. Outside of the Creston Valley flats/marshlands, the EA-C falls within a Medium Smoke Sensitivity Zone.</i></p>
Kootenay Boundary Higher Level Plan	<p>The Kootenay Boundary Land Use Plan Implementation Strategy was completed in 1997 and was discussed in the previous CWPP.</p> <p><i>Legal, spatially defined objectives for 'Connectivity Corridors', and 'Water Intakes Used for Human Consumption' apply within the AOI. A non-legal objective for fire-maintained ecosystem restoration also applies - this provision targets NDT4 ecosystems, which are present in the WUI (see Section 4.2.1).</i></p> <p>It must be noted that many of the KBHLP (Kootenay Boundary Higher Level Plan) objectives have been replaced with other legislation such as Government Actions Regulation (GAR) for special management of certain forest values including caribou habitat.</p>

⁹ https://www2.gov.bc.ca/assets/gov/public-safety-and-emergency-services/wildfire-status/prevention/fire-fuel-management/fuels-management/wui_wrr_plan_development_standard_and_guidance_document.pdf

Plan/Legislation	Description and Relationship to CWRP
Wildfire Act and Regulation	Dedicated to wildfire management in BC. Key objective of the legislation is to specify responsibilities and obligations with respect to fire use, prevention, control and rehabilitation.
Parks Act	The Parks Act protects parks from wildfires through regulations, emergency responses, and collaboration with fire management efforts. Inclusive in this act, is an outline of authorities to prohibit or control the use of fire within Parks.
BC Parks and Protected Areas Management Plans and Strategic Statements	<p>Outlines management objectives for a park / protected area and any special considerations. Would provide strategic direction for proposed activities in parks, including fuel management. Management plans are available for parks in the WUI:</p> <p>Stagleap Provincial Park Purpose Statement and Zoning Plan (2003)</p> <ul style="list-style-type: none"> - Protect remnant subalpine ecosystems including mountain caribou habitat - Tourism rest stop
The Forest Act	<p>Establishes the framework for managing forest resources, including provisions that can influence wildfire management. Key aspects include:</p> <ul style="list-style-type: none"> - Provincial Forest and Wilderness Areas: The Act allows for the designation of Provincial forests and wilderness areas, facilitating coordinated management strategies that can include wildfire prevention and response measures. - Timber Supply Areas and Allowable Annual Cut: By designating timber supply areas and determining allowable annual cuts, the Act ensures sustainable forest harvesting, which can reduce fuel loads and mitigate wildfire risks. - Removal of Dead or Damaged Timber: The Act provides mechanisms for the timely removal of dead or damaged timber, such as that affected by insect infestations, to prevent significant value loss and minimize wildfire hazards. - Prohibited Timber Cutting: Unauthorized cutting, removal, or destruction of Crown timber is prohibited under the Act, helping to maintain forest health and reduce activities that could increase wildfire risks.
Emergency and Disaster Management Act	The Act provides the necessary legal authority and organizational structure to effectively manage emergencies and disasters, inclusive of wildfire risks through mitigation, preparedness, response, and recovery efforts

SECTION 3: COMMUNITY DESCRIPTION

This section defines the planning area for this CWRP and provides general demographic information about Electoral Area C. An understanding of population trends, land use patterns, and values at risk can help effectively direct FireSmart outreach and risk mitigation activities.

3.1 AREA OF INTEREST AND WILDLAND-URBAN INTERFACE

The Area of Interest (AOI) for this CWRP is defined by the boundaries of Electoral Area C. Only a portion of this is within the Wildland-Urban Interface (WUI). The WUI is defined by FireSmart Canada as the zone where structures and other human development meet or intermingle with undeveloped wildland or vegetative fuels. For the FireSmart Community Funding and Supports (FCFS) program, the 'Eligible WUI' is considered as the area 1 km from a structure density class greater than six structures per square kilometer. This is a departure from the 2017 CWPP, which used a 2-km buffer on the same structure density class. BC Wildfire Service generates WUI spatial layers and WUI Risk Class maps to assist with initiatives related to wildfire risk reduction, including the CRI FCFS program.¹⁰

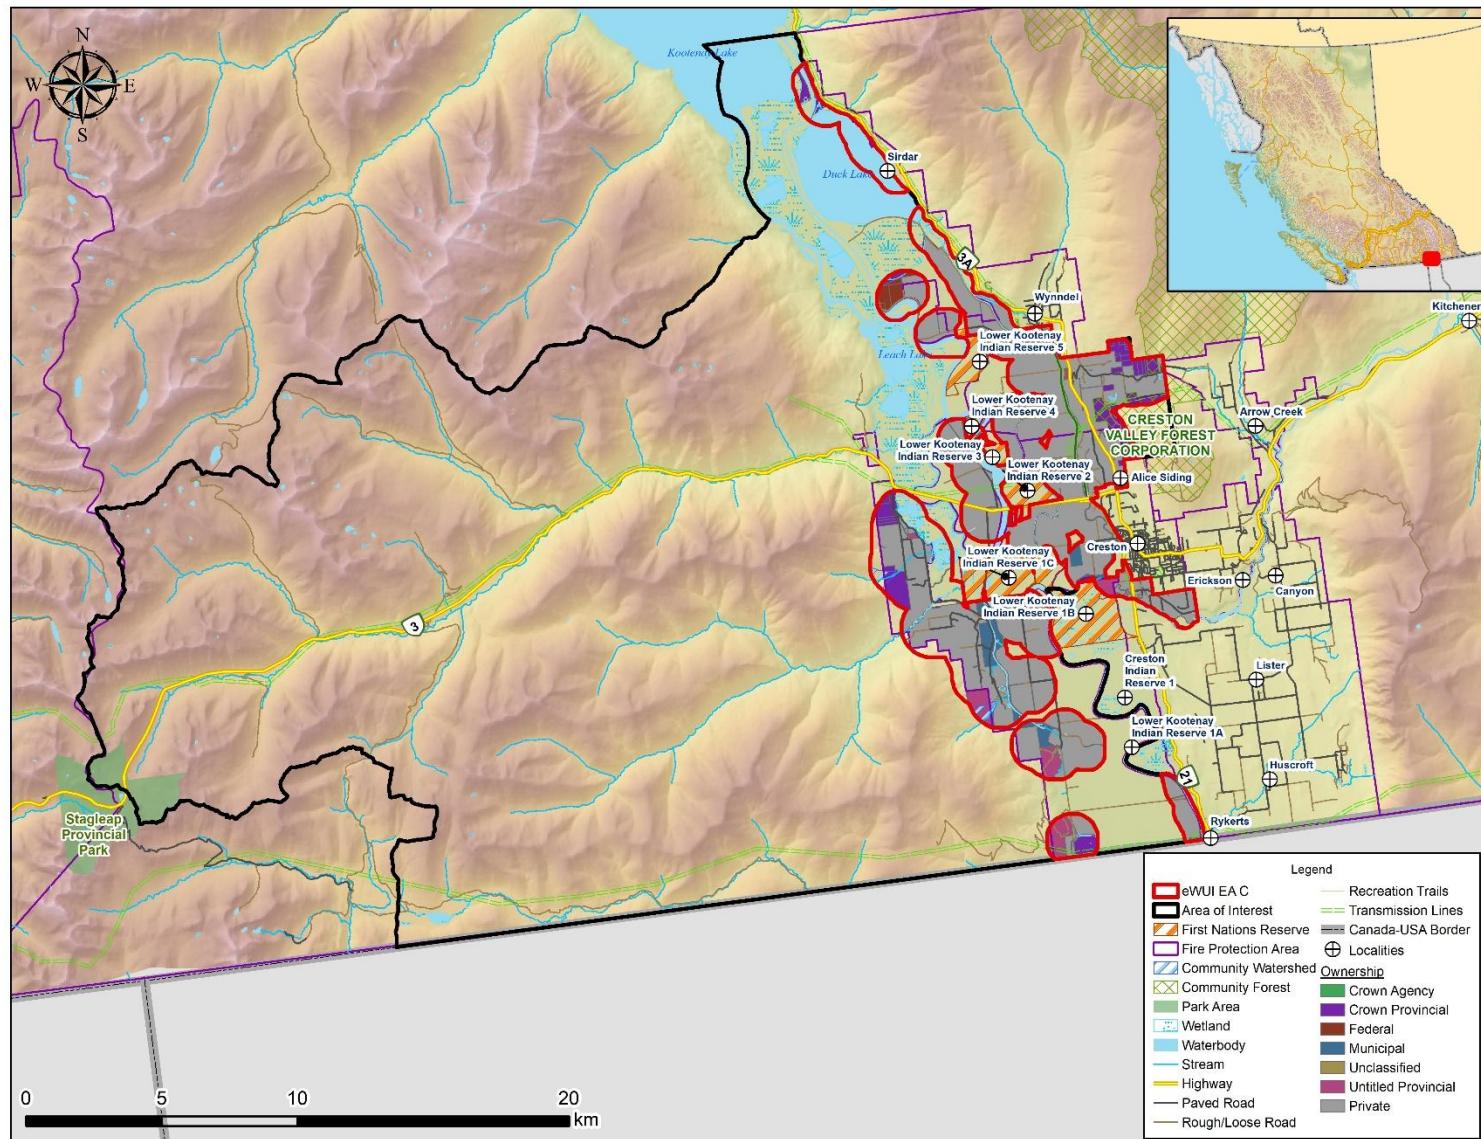

The Eligible WUI was clipped to the boundaries of Electoral Area C, which forms the Area of Interest (AOI) for the CWRP. Field work, GIS analysis, and the recommendations for this CWRP cover only this one kilometer 'Eligible WUI' which covers a total of 15,090 hectares. If development results in new areas exceeding the interface structure density threshold of six structures per square kilometer, the Eligible WUI will grow over time. Note that any parts of this plan's Eligible WUI that are 'new' since 2017 will not contain any CWRP spatial data (fuel type, local fire threat, or proposed treatment units) due to the limitations of this update.

Map 1 shows an overview of the wildland urban interface (WUI) in Electoral Area C, with an approximate breakdown of land ownership type by area listed in Table 5. A substantial portion of the WUI consists of private land, accounting for approximately 67% of the total land area. This predominance of privately-owned land highlights the importance of proactive FireSmart practices by property owners. Most of the remaining area is Crown land, emphasizing the need for collaborative efforts among land users to address wildfire risk across the jurisdiction.

Table 5: Land ownership within Electoral Area C's WUI.

Land Ownership	Area (Ha)	Percent of WUI (%)
Crown Agency	0	0%
Crown Provincial	786	8%
Federal	144	1%
Mixed Ownership	0	0%
Municipal	401	4%
Municipal - RDCK	1	0%
Untitled Provincial	2060	20%
Private/Unclassified	6743	67%
TOTAL	15,090	100%

¹⁰ [Wildland Urban Interface Risk Class Maps - Province of British Columbia \(gov.bc.ca\)](http://www.gov.bc.ca)

3.2 COMMUNITY DESCRIPTION

Electoral Area C is located on the southern edge of the RDCK, immediately west of Creston and east of the Salmo. It includes the communities of Duck Lake, Lakeview, West Creston (Flats), and South Reclamation.¹¹ Adjacent to the eastern slopes of the Selkirk Mountains much of Electoral Area C falls within the historic floodplains of the Kootenay River (before it was reclaimed at the beginning of the last century).

Community access is via Highway 3, which runs west-east through the Electoral Area, and Highways 3A, which roughly bounds the Electoral Area to the east. Electoral Area C shares a border with Idaho (United States) to the south. There is little commercial, tourist, or industrial development in Electoral Area C, except for some wineries and farm-based business in Goat River Bottom. Most residents are served by amenities in the Town of Creston.

The plan area is within the BC Wildfire Service (BCWS) Southeast Fire Centre and Kootenay Lake Fire Zone, (overlap with the Arrow Fire Zone in Stagleap Provincial Park). Structural firefighting services are coordinated through contract with the Town of Creston, with halls located in Lakeview-Wynndel, West Creston and in the Town of Creston. Medical care and ambulance service is provided by the Creston Valley Hospital and Health Centre. Creston also has an RCMP detachment. The RDCK operates no transfer stations in Electoral Area C; the nearest landfill is just outside of Creston in Area B (Canyon Lister).

Table 5 provides an overview of relevant census and socio-economic data, offering valuable insights into the demographics and characteristics of the plan area. Electoral Area C's population is stable, with Statistics Canada recording a 0.2% increase between 2016 and 2021 to 1,475.¹² Like most of the RDCK, the area has a decidedly rural character, with an average of only 2 people per square kilometer. As of 2021, there was a total of 635 private dwellings in the Electoral Area, with a permanent occupancy rate of 90.6% being single-detached homes. Such a high rate of permanent residents presents an ideal opportunity for proactive FireSmart education. This education can have a lasting impact within the community, empowering residents to apply FireSmart principles effectively.

Table 6: Socio-economic statistics for Electoral Area C, as per the 2021 census¹²

Metric	Value
<i>Population</i>	
Total Population	1,475
Population Density (people/km ²)	2
Population percentage change between 2016 and 2021	+0.2%
Number of people <14 years old (% of total population for the area)	13.2%
Number of people 15-64 years old (% of total population for the area)	54.2%
Number of people >65 years old (% of total population for the area)	32.9%

¹¹ <https://www.rdck.ca/EN/main/government/board-of-directors/electoral-areas.html>

¹² 2021 Canadian Census Data.

Metric	Value
Median Age (years)	49.5
Housing	
Total private dwellings (year)	635
Private dwellings permanently occupied	90.6%
Ownership	88.2%
Income and Employment	
Median Total Income of Households	\$61,200

Figure 1. Google Earth image of Lakeview (looking east).

Lakeview

Lakeview is a neighbourhood on the north side of Arrow Mountain, east of Highway 3. The boundaries of three RDCK Electoral Areas meet here. Arrow Creek to the east is in Electoral Area B and Wynndel to the north is in Electoral Area A. Properties are mostly residential. The Wynndel-Lakeview Fire Department (operated by the Town of Creston since 2019)¹³ provides structural and interface fire protection to the community. There are no publicly operated water utilities in Lakeview.

¹³ <https://www.mycrestonnow.com/32529/news/creston-news/town-of-creston-takes-over-canyon-lister-fire-department/>

Duck Lake

Duck Lake as an area refers to structures on Duck Lake Road (part of which is in Electoral Area B, including Canfor WynnWood mill) and includes the farms south of Duck Lake between Kootenay River and Highway 3A.

Figure 2. Google Earth image of Goat River Bottom (south of Creston), looking NNE.

Goat River Bottom

Like Lakeview, Goat River Bottom is a ‘border’ neighbourhood in Electoral Area C. It consists of a small number of agricultural properties between Creston and the Goat River, east of Highway 21. Erickson to the east is in Electoral Area B. This area is within the Town of Creston Fire Protection Area. A small part of the neighbourhood is connected to the RDCK-operated Erickson water system.

Figure 3. Google Earth image of West Creston, looking west.

West Creston

West Creston is a rural residential neighbourhood on the west side of the Creston Valley, south of Highway 3. Agricultural flatlands around the Kootenay River separates West Creston from the Town of Creston. The community is single access/egress from West Creston Road off Highway 3. This area is within the West Creston Fire Protection Area, with the fire department operated by the Town of Creston. The 'flats' part of West Creston is comprised of large agricultural properties extending south down the Creston Valley to the Canada-US border, with few structures (Reclamation Road).

3.3 VALUES AT RISK

Values at risk are the human, natural, or cultural resources that could be negatively impacted by wildfire. Protection of these values during a wildfire event is an important consideration for effective emergency response. Pre-identifying critical infrastructure and values at risk before an emergency event can ensure that essential services can be protected and/or restored quickly.

3.3.1 CRITICAL INFRASTRUCTURE

Critical infrastructure includes buildings and structures that are essential to the health, safety, security, or economic wellbeing of the community and the effective functioning of government.¹⁴ There is currently no critical infrastructure or community assets operated by the RDCK in Electoral Area C; however, the

¹⁴ FireSmart BC. Community Wildfire Resiliency Plan Instruction Guide 2023. November 2023. LGPS_CRI_FCFS2023CWRPInstructionGuideV1.pdf

Erickson water system is included in Table 7 below as some properties in Goat River are serviced. Water and electric systems are discussed in more detail in Sections 3.3.2 and 3.3.3.

All structural fire protection in Electoral Area C is provided by Creston Fire Rescue, with halls located in Wynndel-Lakeview (Electoral Area B), West Creston and the Town of Creston. The RDCK recently held a referendum on the establishment of an annual requisition and a loan authorization so that a new fire hall could be constructed in West Creston, but the proposal did not receive assent by voters.¹⁵

Table 7. Critical infrastructure and community assets identified within the WUI.

Name	Type	Jurisdiction	Location	Comment
Critical Infrastructure				
Electrical Power Systems (Including Non-Utility)	Utilities	FortisBC Inc	Creston	South of 16 th Ave S and Cedar Street
Erickson/Arrow Creek Water System (surface intake, treatment plant, two reservoirs)	Water	Regional District of Central Kootenay	Erickson	
Wynndel Lakeview Fire Hall	Emergency Response	Town of Creston (under contract with RDCK)	Wynndel	
West Creston Fire Hall	Emergency Response	Town of Creston (under contract with RDCK)	West Creston

3.3.2 ELECTRICAL POWER

Wildfires have the potential to impact electrical service by causing disruption in network distribution through direct or indirect processes. For example, heat from flames or fallen trees associated with a fire event may cause power outages. It is important to note that even distant wildfires can result in electrical system disruption, and communities should be prepared for this possibility. For nearly a week in September 2022, the town of Jasper, AB, was running entirely off of a temporary generator system due to wildfire-damaged transmission lines kilometers north of town. It took ATCO, the power authority in the region, approximately 10 days to fully restore power to the town.¹⁶

¹⁵ <https://www.rdck.ca/official-results-declared-for-west-creston-fire-protection-service-establishment-amendment-an/>

¹⁶ <https://globalnews.ca/news/9129496/jasper-chetamon-wildfire-power-restored-september-14/>

Fortis BC and BC Hydro provides electrical service in the plan area through a network of transmission and distribution lines. Several transmission lines intersect the WUI, roughly paralleling Highway 3A and Highway 3. In the event of a wildfire, electrical utility companies will work with BCWS crews to protect and monitor electrical infrastructure. The CFRC indicated that there is communication between the RDCK and utility providers on right-of-way maintenance; however, it is ultimately the responsibility of the utility companies to manage under the Wildfire Act. Fortis BC also operates natural gas pipelines in Electoral Area C.

Communities can increase their resilience to an emergency that cuts power for days, or even weeks, through robust emergency planning and back-up power for key systems, especially water. Residents on private well systems would be relying on electrical generators to obtain drinking water in the event of a power outage. Vulnerabilities for secondary power sources include mechanical failure, potentially insufficient power sources should a wide-scale outage occur, and diesel fuel shortage in the event of long outages or road closures. Critical infrastructure in the plan area, including water systems and community buildings that could be designated as Local Area Emergency Operations Centres under the RDCK Emergency Response and Recovery Plan, should have a backup power source.

3.3.3 WATER AND SEWAGE

Drinking water supply within Electoral Area C is provided by community water systems or private intakes (wells or surface water intakes). A small part of Goat River Bottom east of the CP rail line is connected to the RDCK-operated Erickson water system. Detailed information on each RDCK water system is provided on the RDCK website.¹⁷ Erickson is the largest water system that the RDCK operates, providing drinking water to properties in parts of Electoral Area B, Electoral Area C, and the Town of Creston. Source water is from Arrow Creek. There are no sewer or wastewater treatment systems within Electoral Area C; residents rely on private septic systems.

There are several community watersheds in Electoral Area C, all of which provide surface water to clusters of residents in West Creston through individual, privately-run water systems:

- Urmston Community Watershed (Urmston Creek)
- Teetzel Creek Community Watershed (Teetzel Creek)
- Mortimer Community Watershed (Mortimer Creek)
- Cameron Community Watershed (Cameron Brook)

Fire hydrants are only located in the area serviced by the Erickson water system and coverage (pressure and quantity) meets standards for firefighting. For the many areas not serviced by hydrants, the provision of water suppression for firefighting relies on drafting from natural water sources, which include the

¹⁷ <https://www.rdck.ca/EN/main/services/water/rdck-water-systems.html>

Kootenay River, Goat River, Arrow Creek, Duck Lake, Leach Lake, and various creeks. See Section 5.4 for recommendations related to fire department resources, including water source mapping.

3.3.4 HAZARDOUS VALUES

Hazardous values are defined as values that pose a safety hazard to emergency responders and include large fuel (e.g., propane) facilities, landfills, rail yards, storage facilities containing explosives, and pipelines. Anywhere combustible materials, explosive chemicals, and gas or oil is stored can be considered a hazardous value, which in the Eligible WUI, could include farms. Protecting hazardous values from fires is important to prevent interface fire disasters. No specific hazardous infrastructure was identified in the plan area.

3.3.5 CULTURAL VALUES

Both registered and undocumented historic and archeological sites may be found within the WUI, in addition to locations with high cultural value to local First Nations. Known archeological sites are protected under the Heritage Conservation Act, which applies to both private and public lands.

The RDCK should continue to consult with applicable First Nations well before development and implementation of any proposed fuel prescriptions to allow for meaningful review and input, as well as collaborative opportunities. Archaeological assessments or cultural use surveys may be required to ensure that known or unknown cultural resources are not inadvertently damaged or destroyed, and that First Nations strategies for land management in their traditional territory are complied with.

3.3.6 HIGH ENVIRONMENTAL VALUES

There are numerous environmental values at risk throughout Electoral Area C. The Creston Valley Wildlife Management area, managed by the Ministry of Forests under the Conservation Lands program, overlaps the WUI in West Creston. Stagleap Provincial Park is on the western edge of Electoral Area B but is outside the WUI. The RDCK has not designated any environmental or riparian Development Permit areas in Electoral Area C.

There are substantial overlaps with species and ecosystems at risk identified through the B.C. Conservation Data Center (Table 8). As part of due diligence on public land, any prescriptions developed for fuel management treatment (see Section 5.7) should identify and mitigate potential impacts to ecosystems or species at risk. Prescriptions may require rationales and/or mitigation measures for tree removal in some areas, especially where overlapping with designated wildlife areas. There is no Ungulate Winter Range or Wildlife Habitat Areas overlap, but the entire WUI overlaps federally designated critical habitat for species at risk (woodland Cariboo, American badger, Northern Leopard frog).

Table 8: Species and Ecosystems at Risk in the WUI – BC Conservation Data Center.

English Name	Scientific Name	BC List	Category	Habitat Type
Alkali-Marsh Butterweed	<i>Senecio hydrophilus</i>	Red	Vascular Plant	TERRESTRIAL
American Avocet	<i>Recurvirostra americana</i>	Blue	Vertebrate Animal	LACUSTRINE: Shallow Water; PALUSTRINE: Herbaceous Wetland, Temporary Pool.
American Bittern	<i>Botaurus lentiginosus</i>	Blue	Vertebrate Animal	HERBACEOUS WETLAND

Whitebark Pine	<i>Pinus albicaulis</i>	Blue	Vascular Plant	PALUSTRINE: Herbaceous Wetland, Pond; TERRESTRIAL: Subalpine, Forest Needleleaf, Grassland/Herbaceous

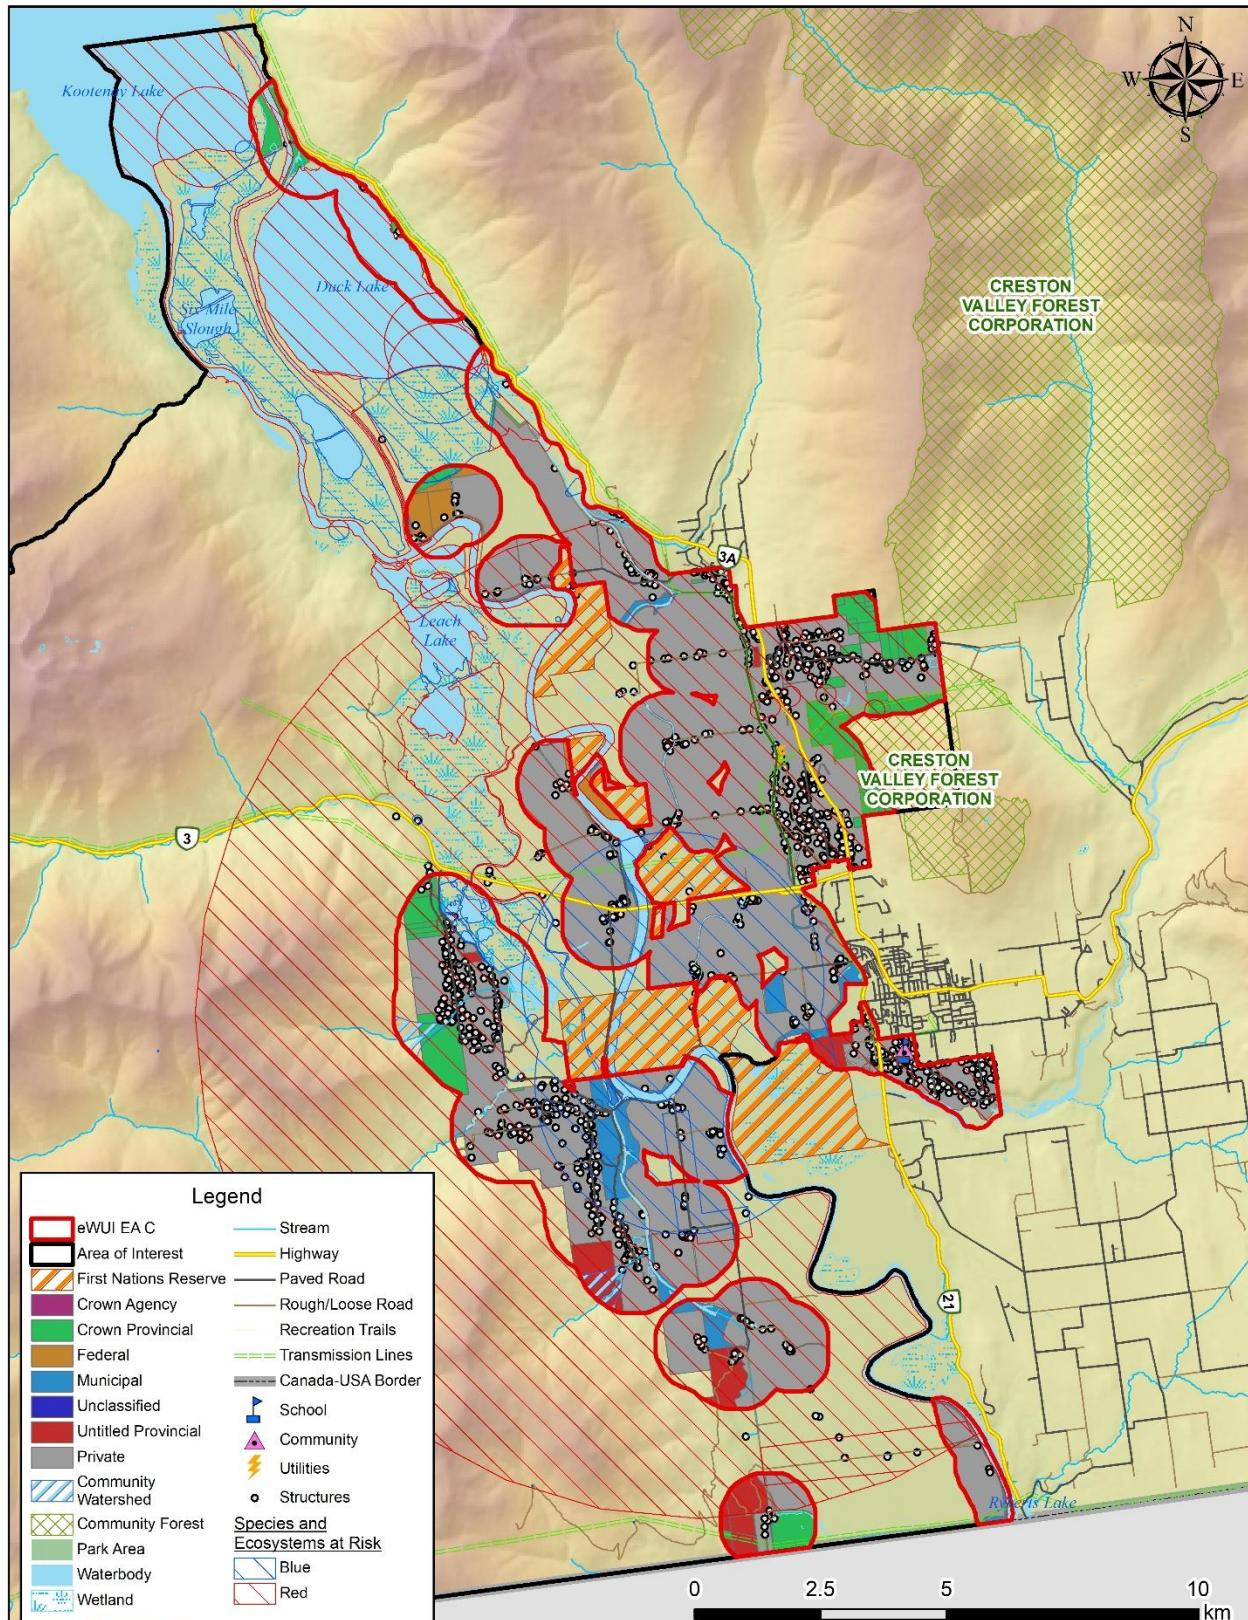

3.3.7 OTHER RESOURCE VALUES

There are other important resource values associated with the land base, including forestry, agriculture (commercial and hobby farms), recreation and tourism. There is little area-based forest tenure that overlaps the WUI; only a small portion of the Creston Community Forest (CCF) tenure on Arrow Mountain. Most harvesting in Electoral Area C occurs further west along Highway 3, outside of the WUI.

There are no designated recreation sites or RDCK-operated parks within the WUI, but there are several community parks, in addition to trails in the Creston Valley Wildlife Management Area and on Arrow Mountain. The Trails for Creston Valley Society is active in supporting and expanding trail networks throughout the area.¹⁸

Any fuel management within Electoral Area C should consider the impact on any of these additional values and consult with appropriate land managers, licensees, and stakeholders groups in the area. Recommendations regarding interagency cooperation are discussed in Section 5.5.

¹⁸ <https://www.crestonvalleytrails.ca/>

SECTION 4: WILDFIRE RISK ASSESSMENT

This section summarizes the factors that contribute to local wildfire risk in Electoral Area C. Section 4.1 discusses the wildfire environment in the WUI: focusing on topography, fuel, and weather. Section 4.2 and 4.2.3 discuss wildfire history in the area and wildfire response data from local fire crews. Section 4.3 summarizes the local risk assessment conducted for the last CWPP in 2017, clipped to the 1 km Eligible WUI. A full update of fuel types and local wildfire threat was outside the scope of this CWRP update.

The relationship between wildfire risk and wildfire threat is defined as follows:

$$\text{Wildfire Risk} = \text{Probability} \times \text{Consequence}$$

Where:

Wildfire risk is defined as the potential losses incurred to human life and values at risk within a community in the event of a wildfire.

Probability is the threat of wildfire occurring in an area and is expressed by the ability of a wildfire to ignite and then consume fuel on the landscape. An area's *wildfire threat* is controlled primarily by:

- **Topography:** Slope and terrain features can influence rate of spread; aspect can affect pre-heating and other fuel properties
- **Fuel:** Amount, vertical and horizontal arrangement, type, and dryness
- **Weather:** Temperature, relative humidity, wind speed and direction, precipitation

Consequences refer to the repercussions associated with fire occurrence in a given area. Higher consequences are associated with densely populated areas, presence of values at risk, etc.

4.1 WILDFIRE ENVIRONMENT

There are three environmental components that influence wildfire behavior: topography, weather, and fuel. These components are generally referred to as the 'fire behaviour triangle' (Figure 4); the ways in which they individually influence the wildfire environment of the area will be detailed below. Fuel is the only component of the fire triangle that can be reasonably managed through human intervention. It is important to recognize that in WUI fires, wildland fuels (trees, shrubs, branches, etc.) are not the only fuel available to the fire – houses and their exterior construction materials and landscaping vegetation, cars, barbecue propane tanks, and more (anything that is flammable or combustible) is available fuel.

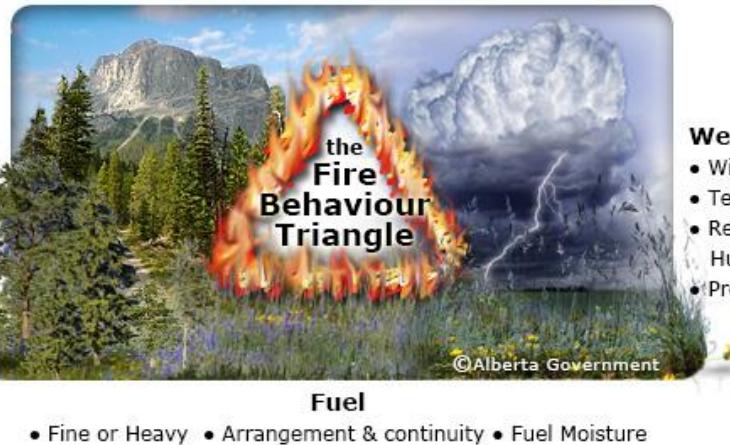

Figure 4. Graphic display of the fire behaviour triangle, and a subset of characteristics within each component.¹⁹

4.1.1 TOPOGRAPHY

Slope steepness influences the fire's trajectory and rate of spread and slope position relates to the ability of a fire to gain momentum uphill. Other factors of topography that influence fire behaviour include aspect, elevation, and configuration of features on the landscape that can restrict (i.e., water bodies, rock outcrops) or drive (i.e., valleys, exposed ridges) the movement of a wildfire. South and southwest-facing slopes are typically the most concerning for heating and solar radiation, which can accelerate fuel drying. Topography also impacts the other aspects of the fire environment. Aspect and slope influences vegetation type and continuity, which is discussed in Section 4.1.2. Also, slope length and form can influence both regional and diurnal wind patterns (e.g., anabatic and katabatic slope winds).

The communities in Electoral Area C are either located on the flat floodplains of the Kootenay River (Goat River) or at toe of forested slopes (Lakeview and West Creston). This development pattern has innate fire resiliency characteristics as most structures are located on flat to gently sloping ground at valley bottom. However, forested slopes above communities pose an access constraint for suppression and fuel mitigation activities, and are associated with accelerated rates of fire spread upslope.

Table 9 presents a breakdown of the WUI based on slope steepness classes, with implications for fire behaviour. The majority of the WUI (65%) is on less than 20% slope, associated with a normal rate of spread. 10% of the WUI is within 21-30% slope, associated with an increased rate of spread as flame tilt will preheat fuel. 12% of the WUI is within the 31-45% slope class where flame tilt and flame and fuel interaction contribute to a high rate of spread. 7% of the WUI is within the 46-60% slope class, associated with a high rate of spread. And 6% of the WUI is greater than 60% slope and associated with an extreme rate of spread.

¹⁹ Graphic adopted from the Province of Alberta.

Table 9: Slope Percentage and Fire Behaviour Implications.²⁰

Slope	Percent of Eligible WUI	Fire Behaviour Implications
<20%	65%	Very little flame and fuel interaction caused by slope, normal rate of spread.
21-30%	10%	Flame tilt begins to preheat fuel, increase rate of spread.
31-45%	12%	Flame tilt preheats fuel and begins to bathe flames into fuel, high rate of spread.
46-60%	7%	Flame tilt preheats fuel and bathes flames into fuel, very high rate of spread.
>60%	6%	Flame tilt preheats fuel and bathes flames into fuel well upslope, extreme rate of spread.

Slope-associated *fire risk* is dependent upon the slope position of values (Table 10). Values located at mid to upper slope have a heightened wildfire risk due to the pre-heating of fuels from fire below and longer flame lengths reaching uphill. As discussed above, most communities in Electoral Area C are located on or near valley bottom, on slopes <30%, so would not have increased fire behaviour influenced by topography and slope position alone. However, there are some structures that are mid-slope, and these would be threatened by faster rates of slope-driven fire spread. It should be noted that fires can also spread downhill, due to downslope winds or rolling debris.

For Electoral Area C, the key topographical feature affecting potential fire behaviour is the presence of continuous forested slopes on either side of the Creston Valley. There is little alpine terrain in proximity to communities in Electoral Area C, so natural topographic breaks to fire spread are limited. Goat River is least at-risk topographically as flat, cleared area surrounds the community for over a kilometer on all sides.

Table 10: Slope Position of Value and Fire Behaviour Implications.²¹

Slope Position of Value	Fire Behaviour Implications
Bottom of Slope/ Valley Bottom	Impacted by normal rates of spread.
Mid Slope - Bench	Impacted by increase rates of spread. Position on a bench may reduce the preheating near the value. (Value is offset from the slope).

²⁰ Adapted from Table 3: Slope Percentage and Fire Behavior Implications; “Determining Wildfire Threat and Risk at a Local Level”; Tools for Fuel Management website. <https://www2.gov.bc.ca/gov/content/safety/wildfire-status/prevention/fire-fuel-management/fuel-management>

²¹ Copied from from Table 5: Slope Position of Value and Fire Behavior Implications; “Determining Wildfire Threat and Risk at a Local Level”; Tools for Fuel Management website. <https://www2.gov.bc.ca/gov/content/safety/wildfire-status/prevention/fire-fuel-management/fuel-management>

Slope Position of Value	Fire Behaviour Implications
Mid Slope – Continuous	Impacted by fast rates of spread. No break in terrain features affected by preheating and flames bathing into the fuel ahead of the fire.
Upper 1/3 of slope	Impacted by extreme rates of spread. At risk to large continuous fire run, preheating and flames bathing into the fuel.

4.1.2 FUEL

Understanding the distribution, type, and management of wildland fuels within Electoral Area C's WUI is vital for developing effective wildfire mitigation and management strategies. Fuel is the only component of the fire triangle that can be realistically managed through human intervention. This section analyses and discusses available *wildland* vegetative fuels within Electoral Area C's WUI.

Electoral Area C exhibits a unique mix of vegetative communities that are influenced by human activities and the region's natural geography. Land clearing for agriculture, industrial, and residential development has altered the vegetative landscape in the valley bottom. This process has resulted in expansive swaths of cleared and/or irrigated farmland and lawns intermixed or interfacing with forested areas. If well-maintained, these clearings effectively reduce the wildfire threat, creating natural firebreaks within the community. Additionally, riparian influence along the waterways results in typically deciduous or mixed vegetation. Deciduous vegetation, with its high moisture content and low volatility characteristics, can reduce fire behaviour and mitigate wildfire risk.

Recent and historic logging has impacted the fire environment of plan area, although most cutblocks are located on upper slopes outside of the WUI. The only visible cutblocks within the WUI are on Arrow Mountain. Regardless, continued efforts to reduce accumulations of slash (harvest debris) in harvested areas will further reduce potential wildfire behavior and associated risk to nearby neighbourhoods. BCWS noted that typically forest licensee compliance with hazard mitigation and open burning under the Wildfire Act is good, and that open burning of grass and agricultural stubble also takes place in Electoral Area C, with few concerns.

The Canadian Forest Fire Behaviour Prediction (FBP) System outlines sixteen fuel types based on characteristic fire behaviour under defined conditions.²² BC Wildfire Service maintains a provincial fuel type layer that was confirmed and updated for the previous 2017 CWPP. Where there were new areas of WUI that did not exist in 2017, the PSTA fuel type data was used. It should be noted that mixed conifer stands²³ in the interior moist belt, within which Electoral Area C's WUI is located, are one of the specifically identified areas of uncertainty and knowledge gaps within the FBP system and are considered, at best, a

²² Forestry Canada Fire Danger Group. 1992. Development and Structure of the Canadian Forest Fire Behavior Prediction System: Information Report ST-X-3.

²³ Species such as western white pine and western larch growing in multi-story canopies, usually associated with Douglas-fir, redcedar, lodgepole pine, or other species.

poor match with any fuel type.²⁴ The FBP system was almost entirely developed for boreal and sub-boreal forest types, which do not occur within the study areas. Furthermore, fuel types depend heavily on Vegetation Resource Inventory (VRI) data, which is gathered and maintained to inform timber management objectives, not fire behaviour prediction. Although a subjective process, the most appropriate fuel type was assigned based on research, experience, and practical knowledge; this system has been successfully used within BC, with continual improvement and refinement, for 25 years.²⁵ In some areas, aerial imagery is of low spatial resolution and/or ground access was impossible, making fuel type assessment difficult. Table 11 lists the percentage of fuel types and associated wildfire behaviour within the WUI; fuel types within the WUI are displayed on Map 3.

According to local BCWS representatives, grassy (O-1a/b) fuels on valley bottom and on private farmland are a concern due to their rapid drying and high susceptibility to fire. Crews must be prepared for grass fires early in the season, after snowmelt but before leaf-out. Open C-7 stands can also exhibit rapid fire spread when fine fuels are dry.

Table 11: Fuel types in Electoral Area C's WUI

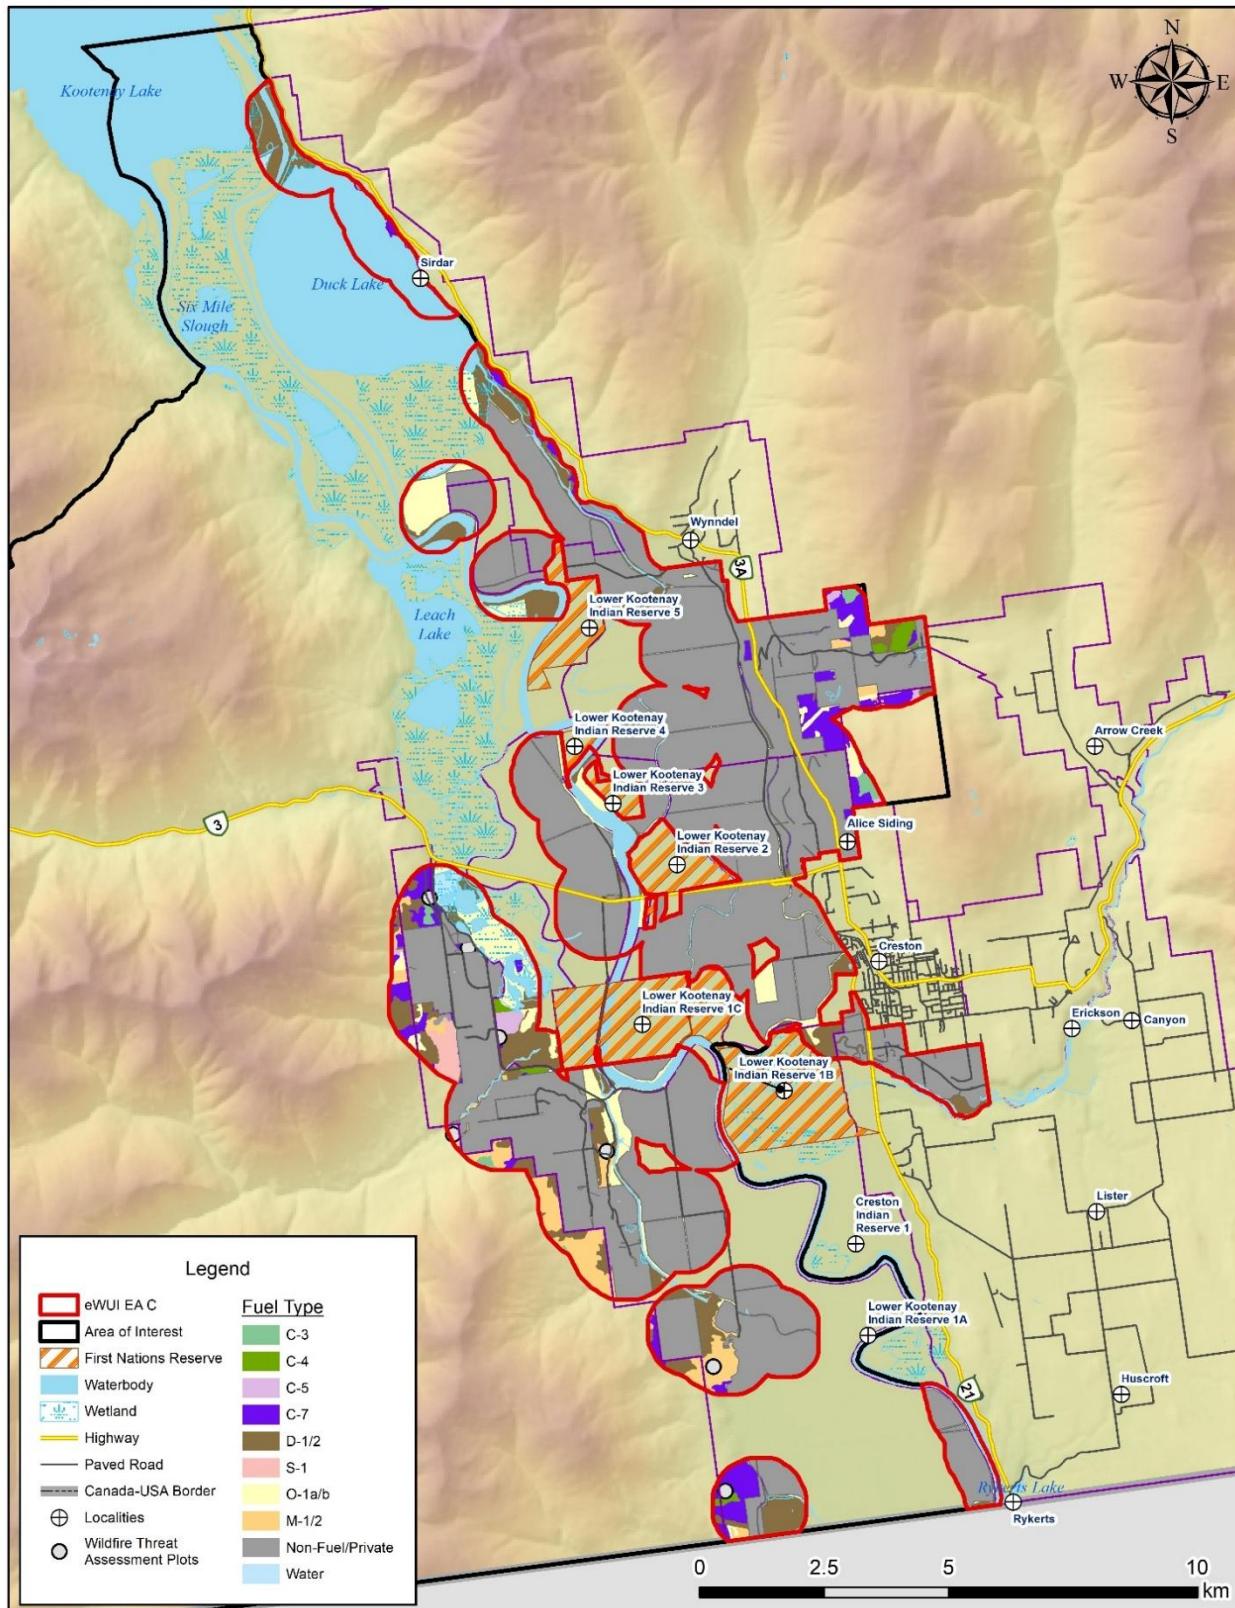

Fuel Type	Fuel Type Description	Wildfire Behaviour Under High Wildfire Danger Level	Area (ha)	Percent (%) of public land
C-3	Fully stocked, mature conifer stands with crowns separated from the ground.	Surface and crown fire, low to very high fire intensity and rate of spread.	40	1%
C-4	Dense pole-sapling forest, heavy dead and down, dead woody fuel, vertical crown fuel continuity.	Almost always crown fire, high to very high fire intensity and rate of spread.	52	2%
C-5	Well-stocked mature forest, crowns separated from ground. Moderate understory herbs and shrubs. Little grass or surface fuel accumulation.	Low to moderately fast spreading, low to moderate intensity surface fire.	40	1%
C-7	Mature and open forest stands with a mix of flashy grass fuels and lower flammability shrubs.	Surface fire spread, torching of individual trees, rarely crowning (usually limited to slopes > 30%), moderate to high intensity and rate of spread.	457	13%
D-1/2	Deciduous stands/forest. Hazard increases with the amount of deadfall and/or establishment of a flammable shrub layer.	Always a surface fire, low to moderate rate of spread and fire intensity.	955	28%
M-1/2	Moderately well-stocked mixed stands of conifer and deciduous, low to moderate dead stems and down woody fuels. Often transition to	Surface, torching and crowning, moderate to very high intensity and spread rate (depending on slope	320	9%

²⁶ Larch was treated as deciduous during fuel typing to account for its high moisture content.

Map 3. Updated fuel types in Electoral Area C's WUI.

4.1.3 WEATHER

Weather conditions, including relative humidity and wind, along with drought, play pivotal roles in wildfire behaviour. The intricacies of local topography can result in unpredictable and variable weather patterns, further emphasizing the significance of weather as a primary environmental factor influencing fire behaviour. Electoral Area C is within the moist climate subregion of south-central BC. Diverse local topography results in variable weather patterns within this subregion.

The regional climate is characterized by warm, dry seasons, with hot summers and mild winters. Moisture deficits are common on submesic and drier sites, and even mesic sites in hot, dry years. Climate change projections suggest these trends will intensify and point toward even hotter summers and more pronounced droughts. These conditions will create an environment conducive to increased wildfire behaviour, particularly in the context of the region's complex topography.

Historical weather data can provide information on the number and distribution of days when communities in Electoral Area C experience high fire danger conditions. 'High fire danger' is considered with a Canadian Forest Fire Danger Rating System (CFFDRS) Danger Class rating of 4 (High) or 5 (Extreme). Average danger class data for the WUI can be determined from representative BC Wildfire Services (BCWS) fire weather stations. The Pend Oreille weather station, located on the south aspect slopes above the Pend Oreille River at 725 m elevation, was selected as the most representative. The weather station is situated within the ICHxw, which covers 96% of the WUI (Table 12 in the next section). Average fire danger class data for the past 14 years is presented below in Figure 5.

Data from the Pend Orielle fire weather station shows that July, August, and September have the greatest number of High and Extreme fire danger days, with July averaging 15 days, August averaging 23 days, and September averaging 10 days for High and Extreme combined. When combined, 52% of days in those three months exhibit High or Extreme fire danger. It is important to note that High fire danger days are present in May, June, and October, as well.

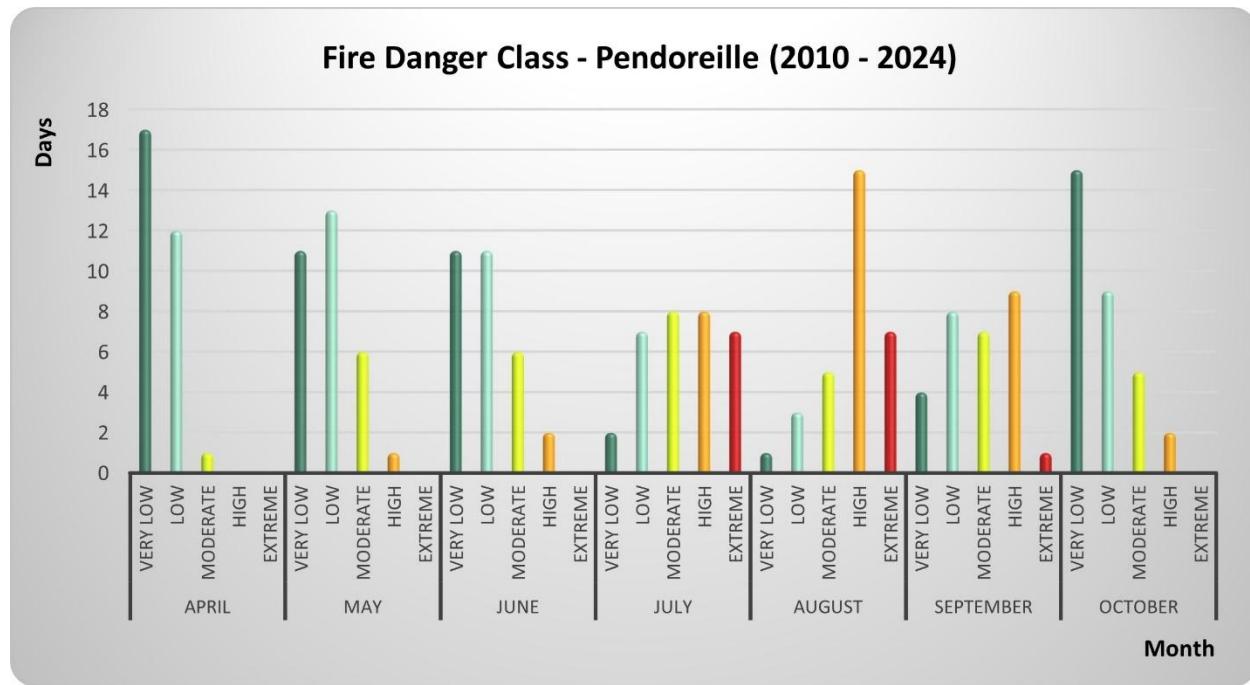

Figure 5. The average number of days by Fire Danger Class for the past 14 years, based on data from the BC Wildfire Services Pend Oreille weather station.

Wind speed and direction are also critical weather components influencing fire behavior, and wind speed and direction are also recorded at BCWS weather stations. Data is publicly available in the form of average Initial Spread Index (ISI) roses. The ISI is a numeric rating of the expected rate of fire spread that combines the effects of wind speed and fine fuel moisture (which is controlled by temperature and relative humidity). ISI roses can be used to help plan the location of fuel treatments on the landscape to protect values at risk based on the predominant wind direction and frequency of higher ISI values. Wildfire that occurs upwind of a value poses a more substantial threat to that value than one which occurs downwind.

During the peak fire season (July to September), the Pend Orielle fire weather station's hourly averages indicate that the plan area primarily experiences strong diurnal winds that originate from the southwest and southeast during the daytime and shift to north and east winds at night. Peak ISI values typically occur during the afternoon. As per Figure 6 below, May to September are peak months for high ISI values. Local BCWS representatives confirmed that July and August are the most dangerous months for fire weather due to high temperatures and low humidity, but that the fire season can extend into September as well. Weather systems like cold fronts that can produce extreme winds are also a concern. Wind is a strong driver of fire behavior in all fuel types in the plan area.

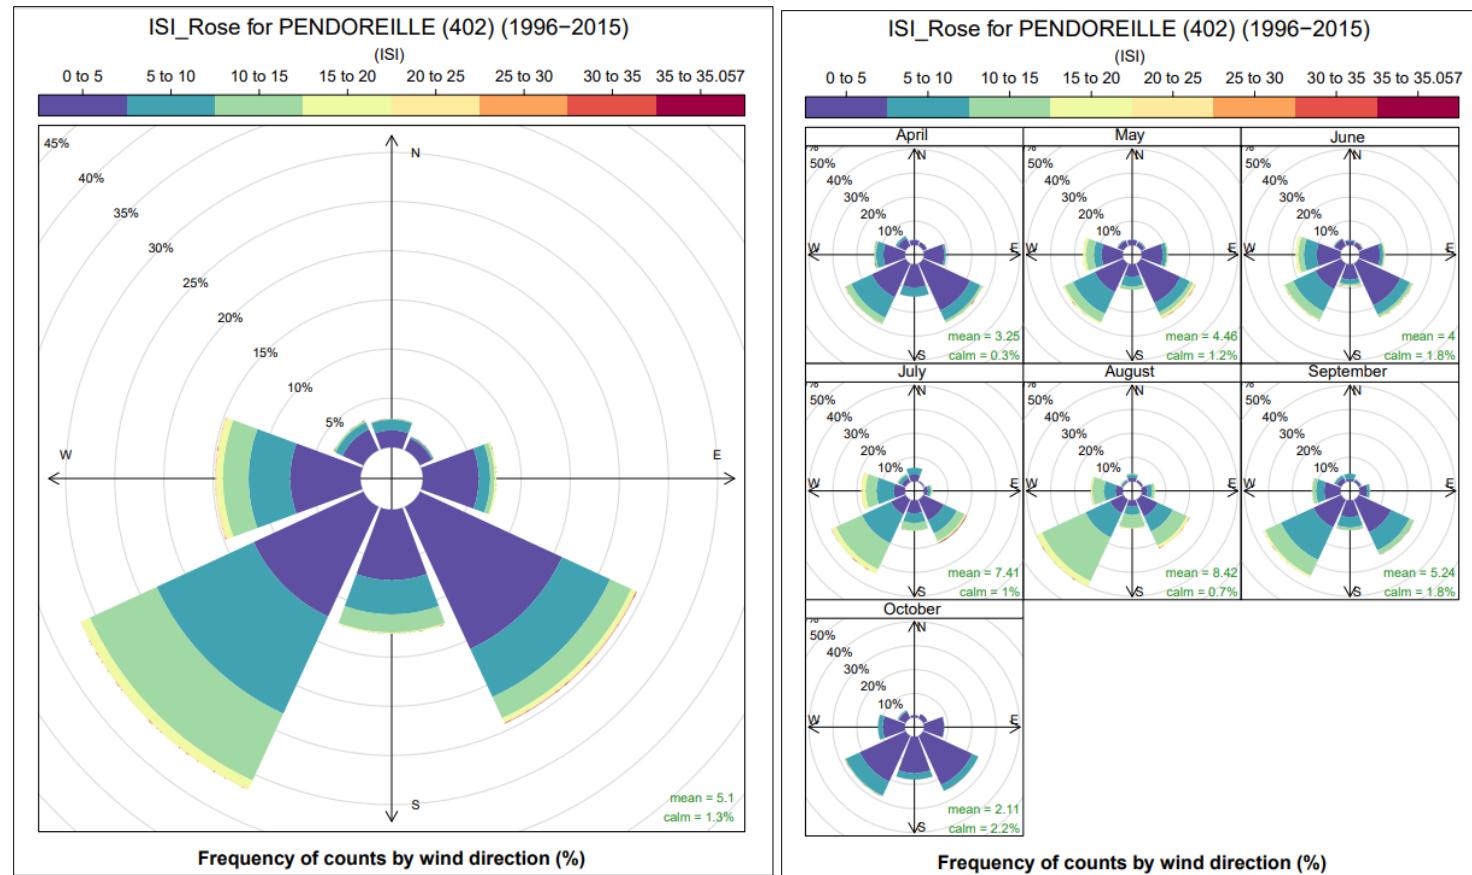

Figure 6. Average daily (right) and monthly (left) ISI values during the fire season (April to October) for the Pend Orielle weather station.

4.2 WILDFIRE HISTORY

4.2.1 HISTORIC FIRE REGIME

The plan area can be classified using the Biogeoclimatic Ecosystem Classification (BEC) system, which categorizes the province into zones by vegetation, soils, and climate. Regional subzones are derived from relative precipitation and temperature.

The distribution of Biogeoclimatic zones and associated Natural Disturbance Types (NDT) within the WUI are displayed in Map 5 and summarized below in Table 12. Situated mainly in the valley bottom at lower elevation, the WUI is predominantly within the Interior Cedar Hemlock very dry warm (ICHxw) subzone. This is associated with an NDT4 regime – ecosystems with frequent stand-maintaining fires. These frequent fires would maintain the existing forest stand structure through frequent, low-intensity fires that would normally regulate the amount of surface fuel build-up and reduce the number of small, sapling-size regenerating trees. A higher frequency and a variable intensity of these types of fires across the landscape would create mosaics of uneven-aged forests and grassy or shrubby openings which naturally restricted the spread of large, severe fires. Larger stand-initiating crown fires may be rarer but historically occurred at intervals ranging from at least 150 to 250 years.²⁷

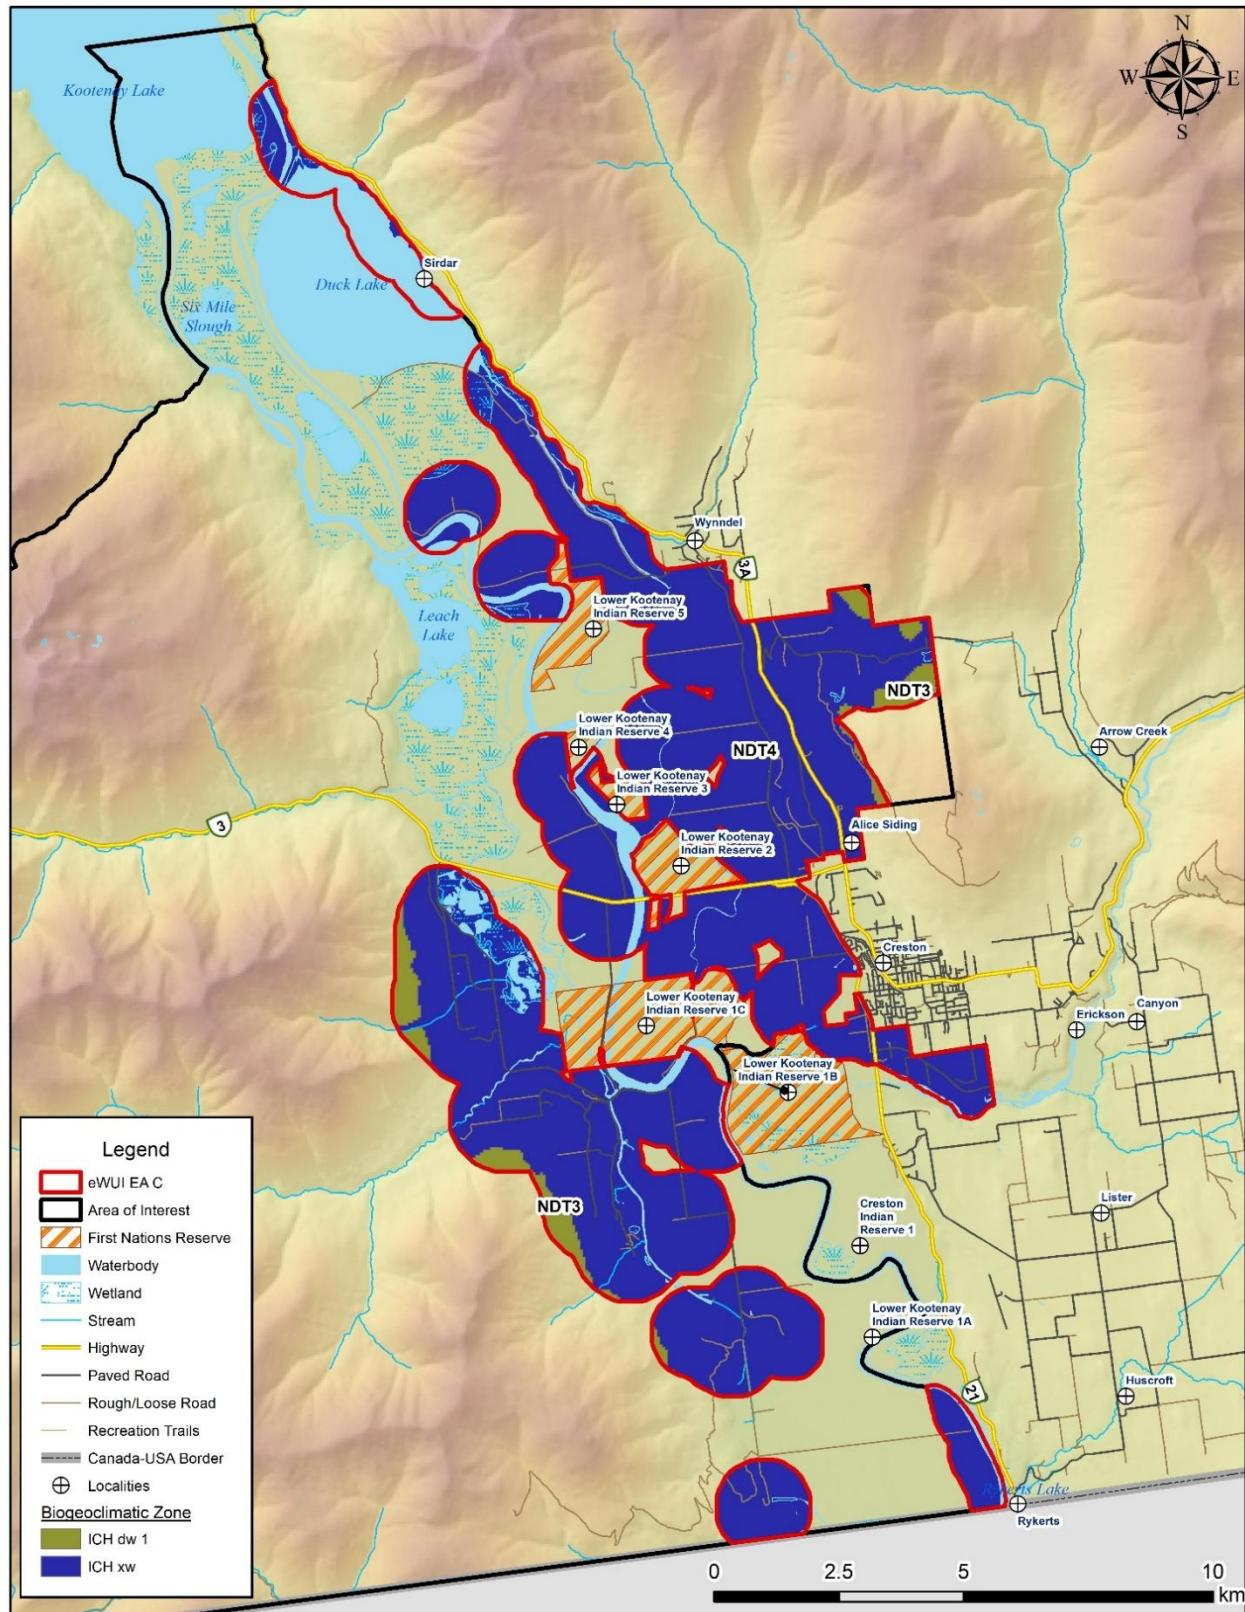

A small portion (4%) of the WUI is within the Interior Cedar Hemlock, Dry Warm (ICHdw1) subzone, occurring on the slopes just above the ICHxw, with an associated NDT3 – ecosystems with frequent stand-initiating events.²⁷ These ecosystems are characterized by frequent wildfires that range from small spot fires to conflagrations covering tens of thousands of hectares.²⁷ This results in a landscape mosaic of stands of different ages with individual stands being even-aged.²⁷ Larger fires often occurred, and could grow to enormous sizes if no topographical-limiting features were present. The mean return interval for fire in the ICH NDT3 is approximately 150 years.²⁷

It is important to consider that fire regimes in the region were likely shaped in part by pre-settlement cultural burning practices by First Nations. It is also important to consider that, in the future, BEC (and associated NDT) distributions will likely shift because of climate change.

Table 12. Biogeoclimatic Zone and associated Natural Disturbance Types (NDTs) of Electoral Area C's WUI.

Biogeoclimatic Zone	Natural Disturbance Type	Area (ha)	Percent of Eligible WUI (%)
ICHdw1	NDT3	381	4%
ICHxw	NDT4	9755	96%

Map 4. Biogeoclimatic Zones in the Eligible WUI.

4.2.2 HISTORICAL WILDFIRE OCCURENCES

The Kootenay region has a history of large mixed-severity and stand-replacing fires. Settlement, particularly logging and mining practices, resulted in an increase in human-caused fires in the late 1800's to early 1900's. During the 1920's to 1940's, miners burned much of the landscape for increased access to and visibility of the underlying geology. Few wildfires over 100 ha have occurred since the 1940's. Figure 7 below displays wildfire occurrences, by size, from 1900 to 2020.

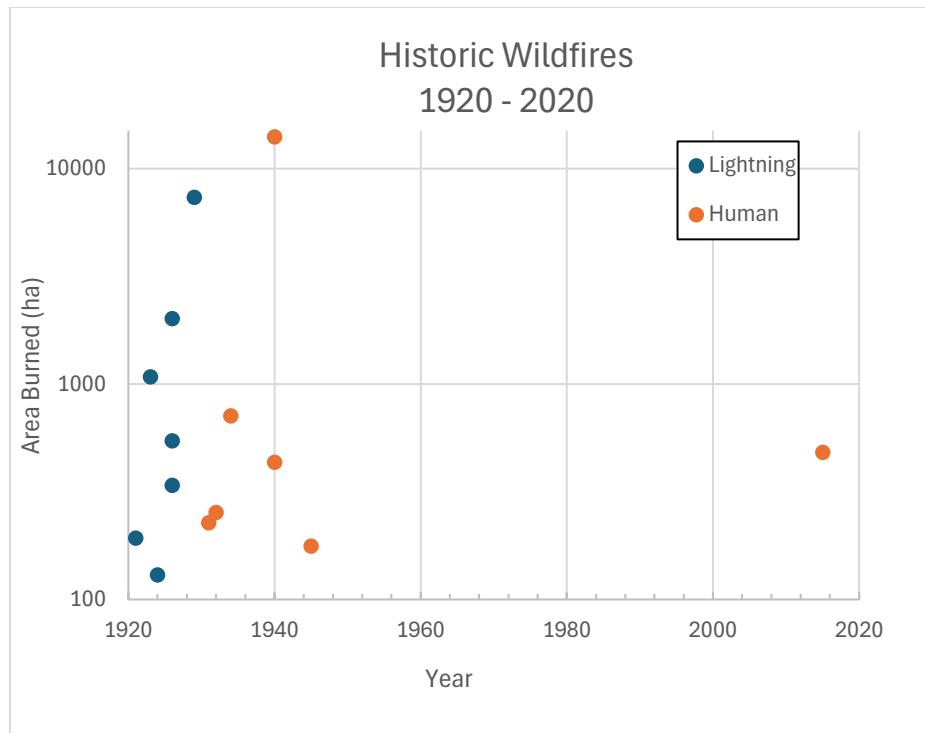

Figure 7. Historic wildfires over 100 ha in size from 1900 to 2023.

BCWS fire ignition data, which records point ignitions that may or may not have developed into a wildfire with a recorded perimeter area, is only available from 1950 onwards. Lighting strikes account for 33% of ignition starts, 34% are human-caused, and 33% unknown. Figure 8 below displays the frequency of wildfire ignitions, grouped by ignition source, from 1950 to 2023. Historic wildfire perimeters and ignition sources, from 1912-2022, are displayed below on Map 5 for an area within five kilometers of the WUI.

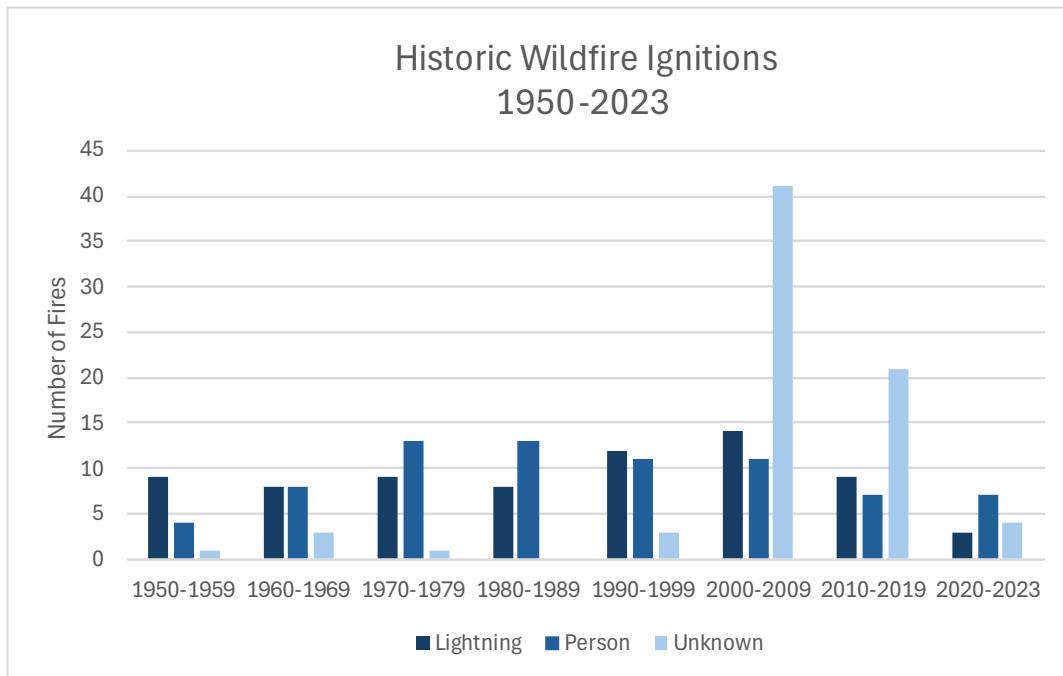

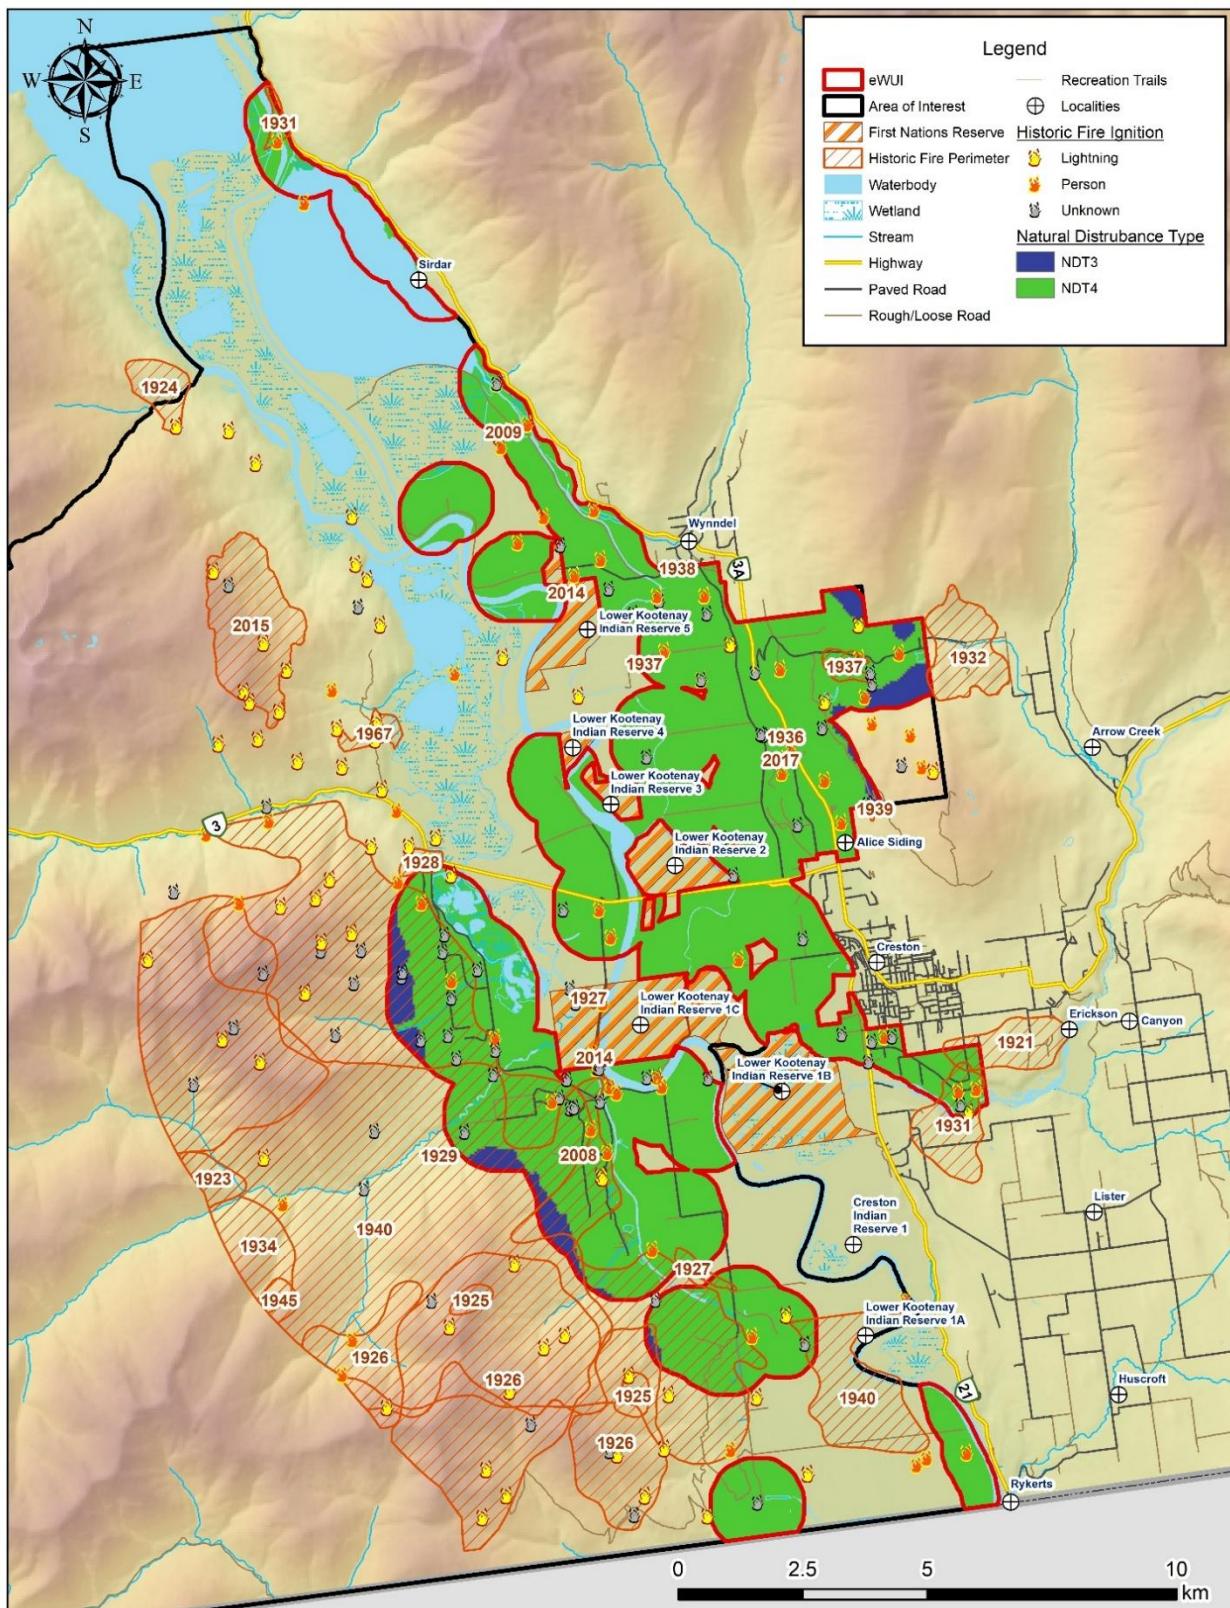

Figure 8. Historic wildfire ignitions from 1950 -2020 by ignition source.

The largest wildfire to occur since the 2017 CWPP was the Six Mile Creek Wildfire (N71011) in August 2022, roughly 14 km northeast of Creston.²⁸ The human-caused fire was actioned by BCWS ground and aviation crews and burned 55.1 ha, according to BCWS post-fire data.

4.2.3 WILDFIRE RESPONSE

Creston Fire Rescue responds just as frequently to wildland fires as to structure fires, if not more so. This is reflected in the level of preparation to respond to wildland fires – as summarized in Section 5.4, Creston Fire Rescue has a wildland/brush truck complete with forestry pump(s), hoses, accessories, and wildland-specific Personal Protective Equipment (PPE) for their members. There are also two Structural Protection Unit (SPU) trailers available in the Creston Valley. Creston Fire Rescue reported an average of 1.9 wildland and 0.5 structure fire calls annually since 2015. This response data demonstrates the importance of wildfire-specific training and equipment and public fire education - wildfires can just as easily begin from a house fire igniting the adjacent forest and wildland fuels. See Section 5 for related recommendations.

BCWS reported that it is not uncommon for residents in Electoral Area C to conduct open burning on their properties for agricultural purposes. These fires occasionally get reported as nuisance fires but generally compliance with the Wildfire Act in the plan area is good, and there has only been one instance in the last 5 years of fire escape from residential open burning.

4.3 RISK FRAMEWORK AND RISK CLASS MAPS

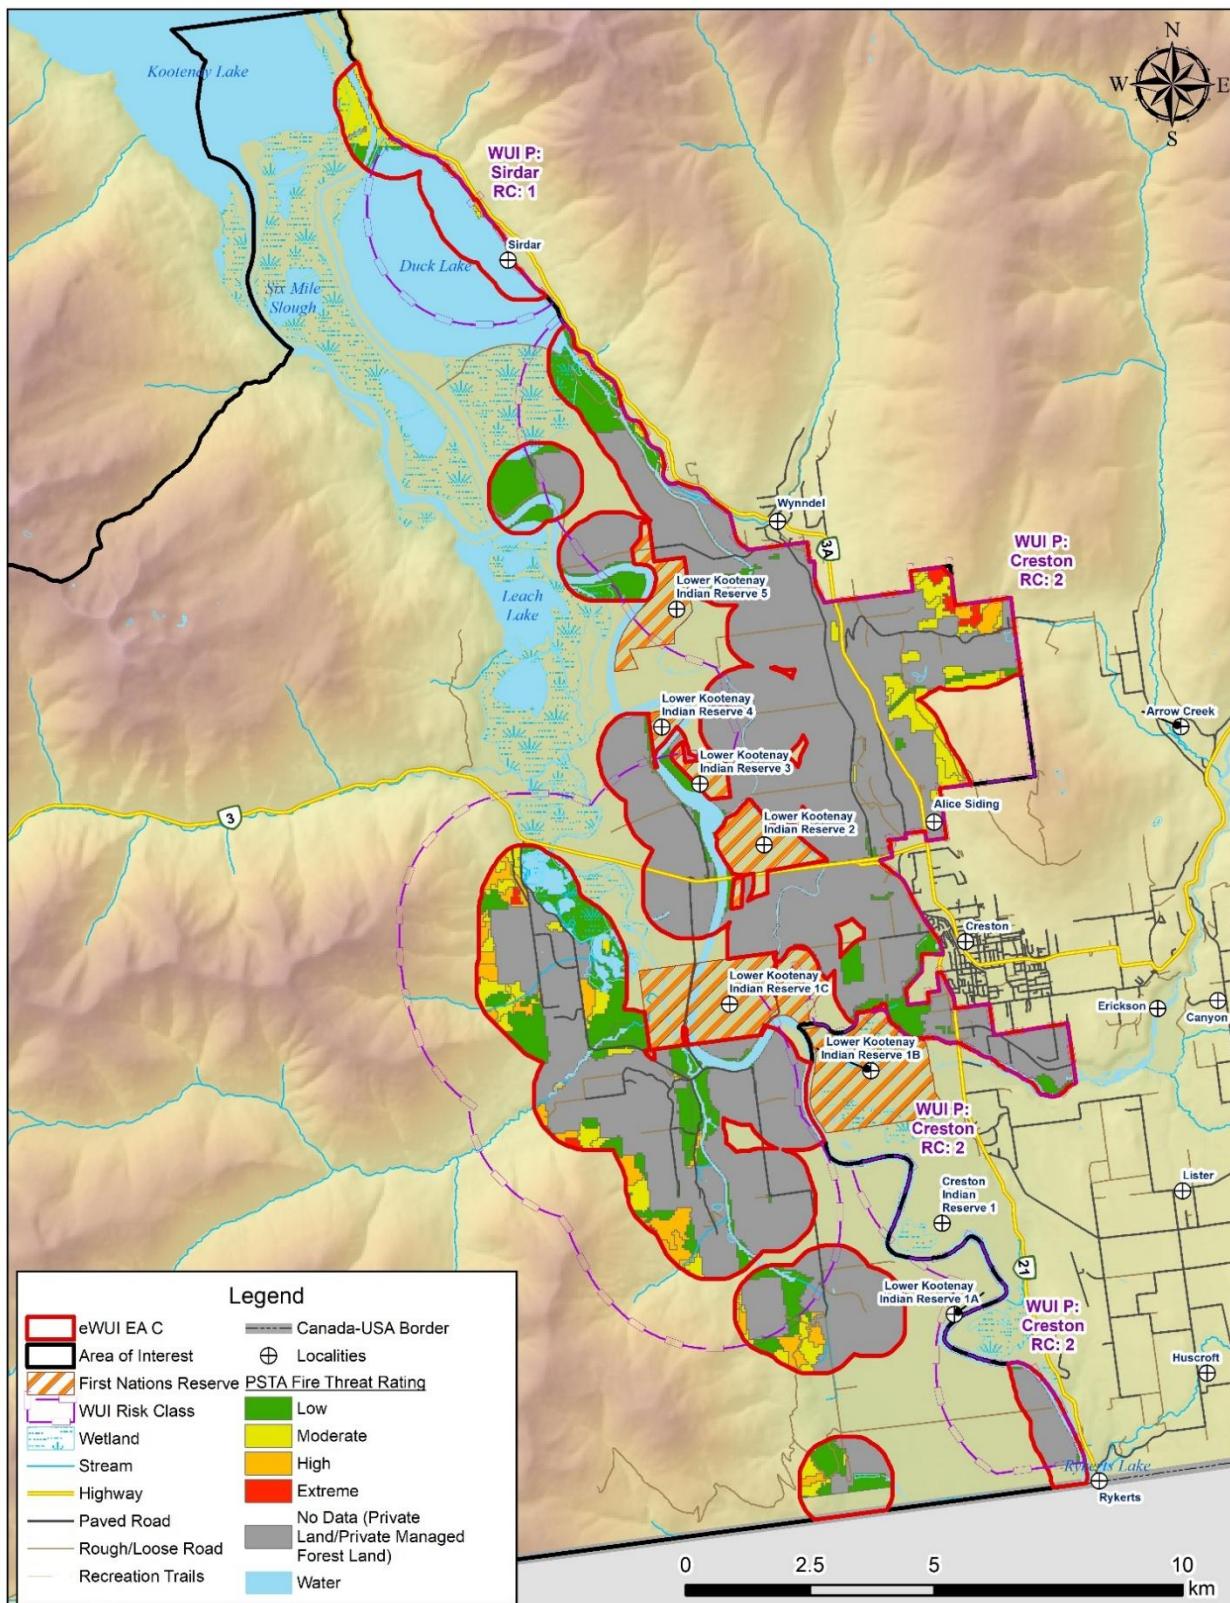

4.3.1 PROVINCIAL STRATEGIC THREAT ANALYSIS

The Province of BC produces a Provincial Strategic Threat Analysis (PSTA, updated in 2021) for all non-private land parcels in BC, designed to consistently assess and map different aspects of wildfire threat and risk around the province.²⁹ This high-level assessment of relative wildfire threat throughout the province is largely based on Vegetation Resource Inventory (VRI) data, fire occurrence patterns, potential fire intensity, and spotting potential. The PSTA ranks threat on a scale of 1 (lowest) through 10 (extreme). The PSTA is a high-level geographic information system (GIS) raster analysis that is suitable for wildfire threat information across the land base; appropriate land management activities need to be determined at the local level using site-specific stand-level information.

The PSTA also forms the basis for the identification of the wildland-urban interface (WUI) in BC. Structure densities are used to define areas of human development. A 1-km buffer is applied on these areas to represent a reasonable maximum distance that embers can travel from a wildfire to ignite a structure. Notably, this threat analysis does not extend onto private land, nor does it account for non-structural values that may be considered values at risk for a community, highlighting the importance of local community wildfire planning.

²⁹ Province of BC. 12 May 2023. 2021 Update: Provincial Strategic Threat Analysis (PSTA). <https://www2.gov.bc.ca/gov/content/safety/wildfire-status/prevention/fire-fuel-management/psta>

Once the WUI is defined, it is combined with the PSTA Fire Threat Rating to delineate discrete 'WUI Risk Class' polygons throughout BC. This framework can be used to prioritize risk reduction initiatives, categorizing WUI polygons by a risk class of 1 (highest) through 5 (lowest). The application of relative risk does not imply "no risk" since the goal is to identify areas where there is higher risk. The PSTA Fire Threat Rating and WUI Risk Class Rating are shown in Map 6 below. Communities in Electoral Area C are in the provincially defined Risk Class 2 (Creston) Wildland Urban Interface (WUI) Risk Class polygon, which reflects the second-highest wildfire risk rating.

Map 6. Provincial Strategic Threat Analysis (PSTA) Fire Threat Rating and WUI Risk Class Rating.

4.4 LOCAL WILDFIRE RISK ASSESSMENT

There are two main components of this local risk assessment: the *wildfire behaviour threat class* (fuels, weather, and topography sub-components) and the *WUI risk class* (structural sub-component). The local wildfire threat assessment process includes several key steps as outlined in Appendix B: Local Wildfire Risk Process and summarized as follows:

- *Fuel type attribute assessment* – ground truthing/verification and updating as required to develop a local fuel type map (Appendix B-1: Fuel Typing Methodology).
- *Consideration of the proximity of fuel to the community* – recognizing that fuel closest to the community usually represents the highest hazard (Appendix B-4: Proximity of Fuel to the Community).
- *Analysis of predominant summer fire spread patterns* – using wind speed and wind direction during the peak burning period using ISI Rose(s) from BCWS weather station(s). Wind speed, wind direction, and fine fuel moisture condition influence wildfire trajectory and rate of spread.
- *Consideration of topography in relation to values* (Table 9 Table 10) - slope percentage and slope position of the value are considered, where slope percentage influences the fire's trajectory and rate of spread and slope position relates to the ability of a fire to gain momentum uphill.
- *Stratification of the WUI* – according to relative wildfire threat based on the above considerations, other local factors, and field assessment of priority wildfire risk areas.

A fuel type and local wildfire threat and risk update was not within the scope of this CWRP update. However, fieldwork was completed to support the re-prioritization of previously proposed fuel treatment units, and identify potential new units. Wildfire Threat Assessment (WTA) plots were completed in select areas of the WUI in late 2024 (see Appendix B-2: Wildfire Threat Assessment Plots and Map 3) only to support the fuel treatment unit updates.

It is important to note that the local WTA analysis does not apply to private land parcels nor any areas outside of the Eligible WUI for this CWRP. As well, the threat assessments quantify threat as it relates to forest fuels, but do not include the ignition potential of residential landscaping, structures, or other infrastructure. Structure fires and structure-to-structure spread in a wildfire scenario are largely attributable to hazardous conditions in the FireSmart Home Ignition Zone of a structure (i.e., the area within 30m of the principal building and/or its attachments).

4.4.1 WILDFIRE THREAT CLASS ANALYSIS

Classes of the wildfire threat class analysis are as follows:

- **Very Low:** Waterbodies with no forest or grassland fuels, posing no wildfire threat;
- **Low:** Developed and undeveloped land that will not support significant wildfire spread;

- **Moderate:** Developed and undeveloped land that will support surface fires that can pose little threat to homes and structures;
- **High:** Landscapes or stands with continuous forested or grassland fuels that will support candling, intermittent crown fires, or continuous crown fires. These landscapes often contain steeper slopes, rough or broken terrain and/or south or west aspects. High polygons may include high indices of dead and downed conifers; and
- **Extreme:** Continuous forested land that will support intermittent or continuous crown fires.

The results of the wildfire threat class analysis carried forwards from the 2017 CWPP and clipped to the 1 km WUI are shown on Map 7 and summarized in Table 13 below. The local threat analysis shows that, for the assessable area (i.e., not private land and removing large water bodies like Kootenay River), a small proportion – 13% – is in a High or Extreme wildfire threat class. Overall, private land totals 70% of the [2017] WUI – this area was not allocated fire threat data. Conditions on private land can often result in the fire hazard being much higher than in the forest adjacent if there is low compliance with FireSmart vegetation and structure principles.

Table 13: Wildfire threat summary for Electoral Area C's Eligible WUI

Wildfire Threat			
Threat Class	Hectares	% of WUI	% of Assessable Public Land
Extreme	0	0%	0%
High	295	3%	13%
Moderate	584	6%	26%
Low	1400	14%	61%
Very Low/No Threat (Water)	787	8%	-
<i>No Data (Private Land)</i>	7071	70%	-

4.4.2 WUI RISK CLASS ANALYSIS

WUI risk classes are quantified when the Wildfire Threat (the above) is assessed as High or Extreme, potentially causing unacceptable wildfire risk when near communities and developments. WUI risk classes are described below:

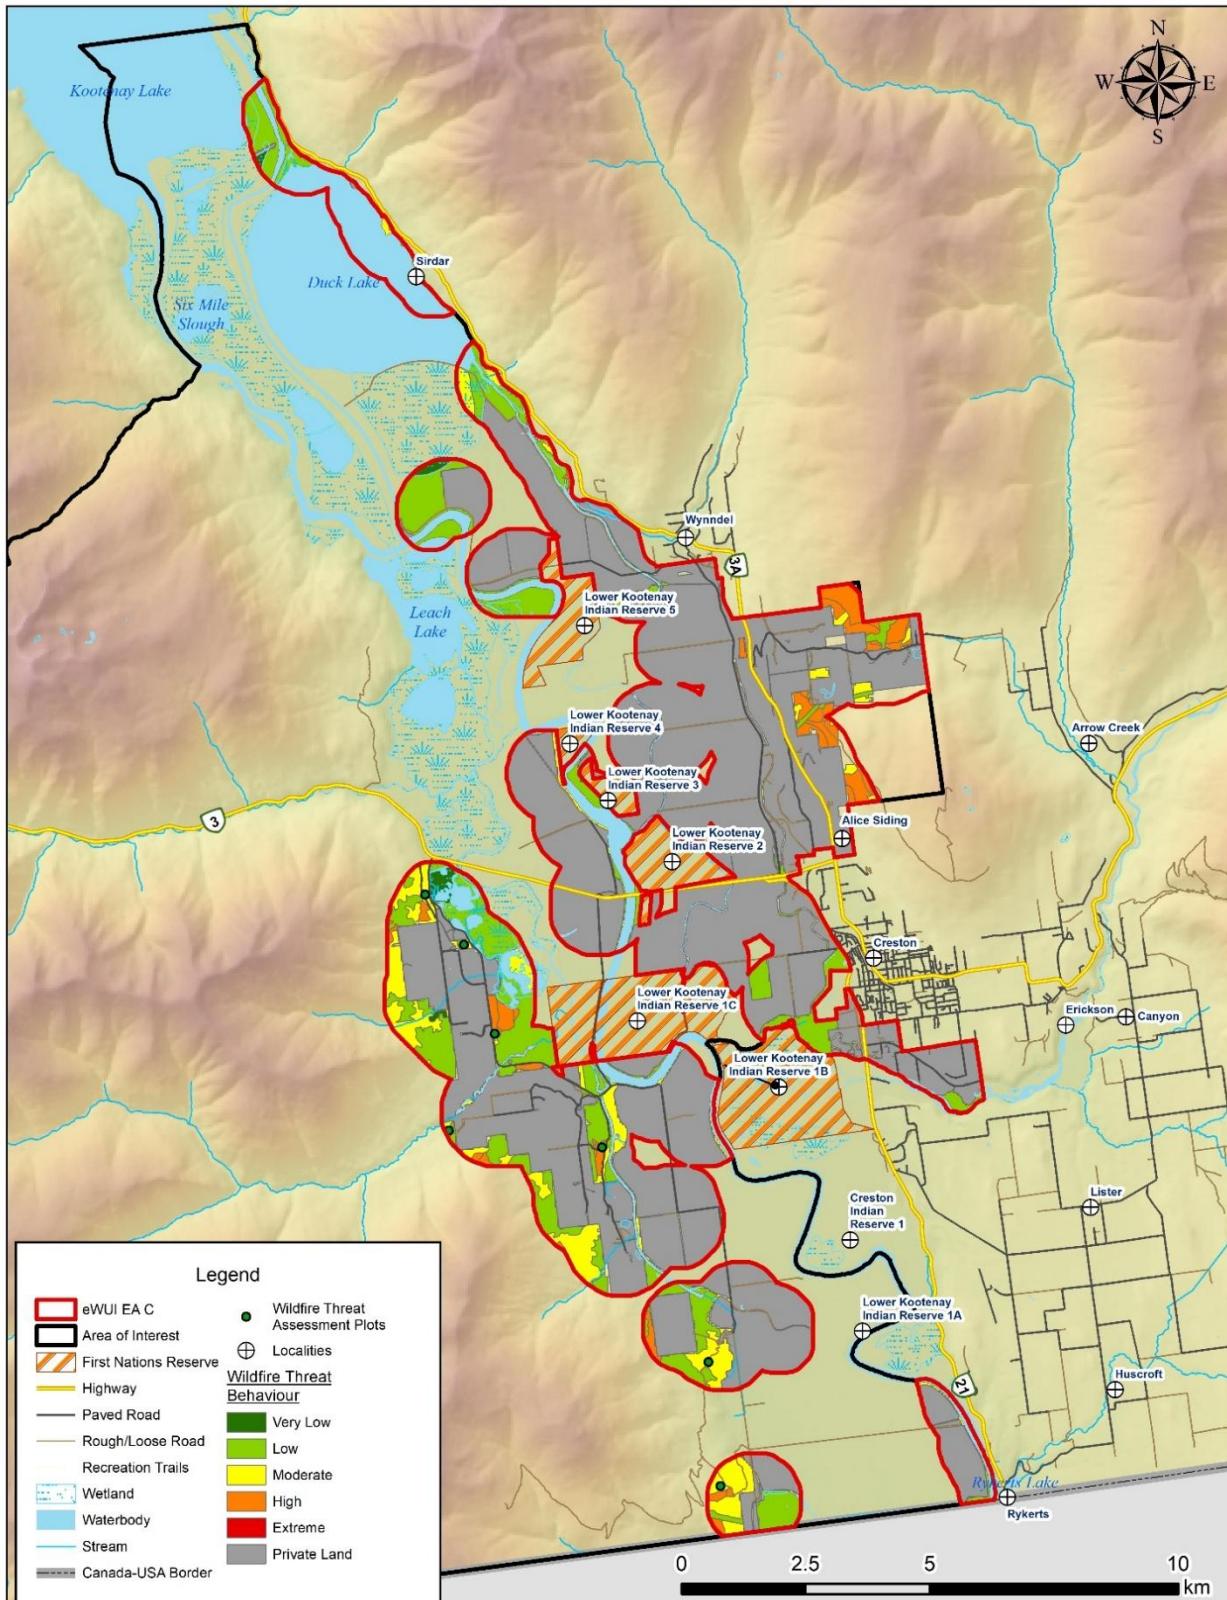

- **Low:** The high or extreme threat is sufficiently distant from developments, having no direct impact of the community and is located over 2 km from structures;
- **Moderate:** The high or extreme threat is sufficiently distant from developments, having no direct impact of the community and is located 500m to 2 km distance from structures;
- **High:** The high or extreme threat has potential to directly impact a community or development and is located 200m to 500m from structures; and

- **Extreme:** The high or extreme threat has potential to directly impact a community or development and is located within 200m from structures.

Table 14 below (and displayed on Map 7) summarizes the risk class ratings within the WUI. Of the 295 ha assigned a High wildfire threat class, 271 ha (92%) have a High or Extreme WUI risk. This represents 9% of the assessable public land in the WUI. This analysis provides an initial step towards identifying priority areas/neighbourhoods for directing FireSmart education and vegetative/fuel management efforts, if practicable.

Table 14: WUI risk class ratings within the Eligible WUI of the Electoral Area C

WUI Risk			
Risk Class	Hectares	% of WUI	% Assessable Public Land
Extreme	44	0%	1%
High	127	1%	4%
N/A (Moderate, Low, Very Low Wildfire Threat Class)	3247	32%	95%
<i>Private / No Data</i>	6717	66%	-

Map 7: Local wildfire threat assessment within the WUI

4.5 HAZARD, RISK, AND VULNERABILITY ASSESSMENT

The purpose of a Hazard, Risk and Vulnerability Assessment (HRVA) is to help a community make risk-based choices to address vulnerabilities, mitigate hazards, and prepare for responding to and recovering from hazard events. The HRVA process assesses sources of potential harm, their likelihood of occurring, the severity of their possible impacts, and who or what is particularly exposed or vulnerable to these impacts.³⁰

An HRVA was not noted, however, the Emergency Response and Recovery Plan for the Regional District of Central Kootenay includes a section on interface wildfire planning (3.10) with listed potential impacts. When an HRVA is completed or updated for Electoral Area C (or the RDCK as a whole), the RDCK should look to the most recent CWRPs and reference their completed wildfire threat class analyses as well as recommendations.

³⁰ Government of BC. HRVA Example Report. https://www2.gov.bc.ca/assets/gov/public-safety-and-emergency-services/emergency-preparedness-response-recovery/local-government/hrva/hrva_forms-step_8-anytown_bc-sample_hrva_report.pdf

SECTION 5: FIRESMART PRINCIPLES

FireSmart™ is the leading program in Canada aimed at empowering the public and increasing neighbourhood resilience through wildfire mitigation measures. It has been formally adopted by almost all Canadian provinces and territories, including British Columbia in 2000. The FireSmart program covers a wide breadth of preventative measures, which are founded in the seven FireSmart disciplines: Education, Legislation and Planning, Development Considerations, Interagency Cooperation, Cross-Training, and Vegetation Management. These seven disciplines and the guiding principles behind FireSmart can be applied at a number of spatial scales and are not restricted to any type of land ownership, forest type or property type. The RDCK and Electoral Area C have an active FireSmart program that is well staffed and funded to complete residential education activities.

Since the development of the 2017 CWPP, 21 of 34 of its recommendations have been wholly or partially implemented. See Appendix A: Review of 2017 CWPP Recommendations.

It has been found that during extreme wildfire events, most home destruction has been a result of low-intensity surface fire flame exposures, usually ignited by embers (firebrands). Firebrands can be transported long distances ahead of the wildfire, across fire guards and fuel breaks, and accumulate in densities that can exceed 600 embers per square meter. Combustible materials found on the exterior of and surrounding homes (the FireSmart Home Ignition Zone) combine to provide fire pathways allowing spot surface fires ignited by embers to spread and carry flames or smoldering fire into contact with structures.

Because ignitability of structures and landscaping vegetation is the main factor driving structure loss, the intensity and rate of spread of wildland fires beyond the community has not been found to necessarily correspond to loss potential. For example, FireSmart homes with low ignitability may survive high-intensity fires, whereas highly ignitable homes may be destroyed during lower intensity surface fire events.³¹ Increasing ignition resistance would reduce the number of homes simultaneously on fire; extreme wildfire conditions do not necessarily result in WUI fire disasters.³² It is for this reason that the key to reducing WUI fire structure loss is to reduce structure ignitability. Mitigation responsibility must be centered on structure owners. Risk communication, education on the range of available activities, and prioritization of activities should help homeowners to feel empowered to complete simple risk reduction activities on their property.

5.1 COMMUNITY OVERVIEW

During CWRP development, FireSmart risk and resiliency factors for different communities were noted (Table 15). This incorporates field observations, the local risk assessment, and information from local government meetings and consultation.

Table 15: FireSmart vulnerability and resilience factors by neighbourhood.

Community	Vulnerability	Resilience
	- Forested interface to the east	- Serviced by a fire department - Defensible space – large agricultural lots, low structure density - Access to two arterial access/egress routes (Highway 3 or Highway 21)
Goat River Bottom	- Minor interface with forest around the Goat River	- Serviced by a fire department - Partially hydrated - Defensible space and low structure density – small agricultural lots - Multiple access/egress options
Lakeview	- Forest intermix	- Serviced by a fire department

³¹ Cohen, J. Preventing Disaster Home Ignitability in the Wildland-urban Interface. *Journal of Forestry*. p 15 - 21.

³² Calkin, D., J. Cohen, M. Finney, M. Thompson. 2014. *How risk management can prevent future wildfire disasters in the wildland-urban interface*. Proc Natl Acad Sci U.S.A. Jan 14; 111(2): 746-751. Accessed online 1 June, 2016 at <https://pmc.ncbi.nlm.nih.gov/articles/PMC3896199/>

Community	Vulnerability	Resilience
	<ul style="list-style-type: none"> - Less defensible space around structures 	<ul style="list-style-type: none"> - Access to two arterial access/egress routes (Highway 3A or Highway 3 via Lakeview Arrow Creek Road)
Goat River Bottom	<ul style="list-style-type: none"> - Minor interface with forest around the Goat River 	<ul style="list-style-type: none"> - Serviced by a fire department - Partially hydranted - Defensible space and low structure density – small agricultural lots - Multiple access/egress options
West Creston	<ul style="list-style-type: none"> - West Creston Road: forest intermix, less defensible space around structures - Single access/egress from West Creston Road off Highway 3 	<ul style="list-style-type: none"> - Within the West Creston Fire Protection Area - Reclamation Road/‘Flats’: defensible space, large agricultural lots, low structure density

The sections to follow provide information on each FireSmart discipline as it relates to Electoral Area C. An analysis of actions that have been implemented are noted, as well as any relevant gaps identified. Each section contains a table of recommended actions for Electoral Area C. Most actions are fundable through the CRI FireSmart Community Funding and Supports program. Each recommendation includes a rationale, lead agency, timeline, and estimated resources to complete.

5.2 EDUCATION

Public education and outreach play a critical role in helping a community prepare for and prevent a wildfire emergency. Awareness of wildfire risk is important, but this needs to be paired with an awareness of potential mitigation actions and locally available FireSmart programs. Participating in wildfire risk reduction and resiliency activities can also promote a sense of empowerment and shared responsibility. A successful public education campaign that builds awareness and understanding among residents and visitors can support the implementation of projects related to other FireSmart disciplines.

The RDCK has been actively engaging communities in Electoral Area C through a well-developed FireSmart program which began over 17 years ago with the completion of CWPPs in 2008 for the Creston Contract Fire Protection Area (West Creston and Goat River Bottom; Lakeview would have been included in the CWPP for the Lakeview-Wynndel Fire Protection Area).³³ Specifically in Electoral Area C, there has been 33 FireSmart Assessments and 7 rebates awarded. There are currently six Wildfire Mitigation Specialists across multiple RDCK electoral areas who work to implement the RDCK FireSmart program.

FireSmart education activities that have been completed or are ongoing include:

- FireSmart Home Assessments (33 in Electoral Area C to date; previously the Home Partner Program, now the FireSmart BC Wildfire Mitigation Program);
- FireSmart demonstration house;
- Distribution of FireSmart educational materials to residents at events (e.g. farmer’s markets);
- Social media updates with FireSmart information and fire danger ratings, and print advertising, and;
- FireSmart workshops and presentations

Because of the large amount of private property within the WUI and the understanding that homes, landscaping vegetation, and all other manner of flammable and combustible materials are considered fuel in the wildfire triangle, a large emphasis should be placed on existing FireSmart education successes and seeking out new opportunities to engage with residents. This includes tourists that may not be knowledgeable on FireSmart and the wildfire risks their actions may carry. Not all efforts will be successfully received by the public, but understanding what activities are not suitable for the community is still valuable information that can be used to refine and improve programming moving forwards.

³³ Regional District of Central Kootenay. 2017. Electoral Area C Community Wildfire Protection Plan Update.

See Table 1 in the Executive Summary for recommended FireSmart Education actions that the RDCK can implement in Electoral Area C.

5.3 LEGISLATION, PLANNING AND DEVELOPMENT CONSIDERATIONS

Legislation and regulation are effective tools for reducing wildfire risk, although they can be less effective in large, rural regional districts like the RDCK. The preference of elected officials in many regional districts is for information sharing rather than enforcement as a policy tool, due to limited bylaw officers and staff capacity. Regardless, how RDCK policies relate to wildfire are still important, as they set the tone for risk recognition and community resilience. Consideration of wildfire at the development planning stage is also a key step in protecting neighbourhoods from wildfire. A summary of RDCK bylaws, policies, and plans relevant to wildfire risk and emergency planning was provided earlier in Section 2.3.

Post-fire studies, experiments, and models have shown that homes ignite due to the condition of the structure and everything around it. This tenant forms the basis of the 'Home Ignition Zone,' which FireSmart BC now defines as the area within 30 m of homes and structures.⁵¹ Legislation, planning, and development standards all play a significant role in building and maintaining FireSmart structures. Factors that can be planned for (and regulated through the land use planning and development process) that affect public safety during a wildfire include:³⁴

- Location of development (including hazardous or vulnerable land uses) in relation to high hazard forested vegetation, steep slopes, and other geographical features that contribute to extreme fire behaviour
- Evacuation and egress;
- Availability and adequacy of water supply for firefighting;
- Type of construction materials on structures and attachments;
- Lot size and structure density;
- Design guidelines and architectural standards;
- Addressing and street signage;
- Landscaping, screening, and buffering; and
- Temporary land uses that determine the type of use and quantity of people.

Section 11 of the Electoral Area C Official Community Plan contains policies to manage interface fire risk, including protecting access to water sources, encouraging FireSmart efforts, and evaluating opportunities to assist in interface forest fuel mitigation treatments. The RDCK also reserves the right to request a fire hazard risk assessment to accompany subdivision applications. No gaps with OCP language as it related to wildfire risk reduction were identified.

When it comes to embedding FireSmart practices and considerations into development, the RDCK has opted for an information sharing approach rather than a regulatory approach. A detailed report was completed in 2023 outlining a range of possible Wildfire DPA guidelines and OCP policy options for the RDCK to consider.³⁵ A lack of staff capacity and poor response from elected officials and residents has tempered interest in a Wildfire DPA throughout most of the RDCK. However, the CFRC indicated that the RDCK is planning to implement a Wildfire DPA in Electoral Area I (between Castlegar and Nelson) as a pilot project. Implementation in other areas of the RDCK is ultimately at the discretion of individual Electoral Area Directors. In the meantime, some development concerns are addressed through the RDCK Bare Land FireSmart assessment program. This free, voluntary assessment is offered throughout the region to residents who are planning to build on undeveloped lots. This program educates residents on FireSmart principles and advises best practices with regards to construction, lot preparation, and landscaping.

³⁴ FireSmart BC. Community Wildfire Resiliency Plan Instruction Guide 2023. Retrieved from: <https://www.ubcm.ca/cri/firesmart-community-funding-supports>

³⁵ Urban Systems. 2023. *Wildfire Development Permit Area Summary Report*. https://www.rdck.ca/assets/Services/Land~Use~and~Planning/Documents/2023-01-06-Wildfire_DPA-Final_Report-Redacted.pdf

Regardless of the challenges involved, it is important to consider that a DPA is currently the most direct option for a local government to impose regulations on development that go beyond the BC Building Code. The purpose of DPAs is to ensure that new development is consistent with the policies of the Official Community Plan (OCP). Especially in areas that may support future medium and higher density residential development, like Goat River Bottom, Wildfire Protection DPAs help ensure that new developments are designed to minimize wildfire hazard and contribute to the fire safety of the neighbourhood, thus limiting property damage should a wildfire occur. The Town of Creston has a Wildfire Hazard DPA in place.

FireSmart principles can also be incorporated into other local bylaws. Several jurisdictions, including the District of Squamish and the City of Nelson, have implemented Wildfire Landscaping Bylaws to prohibit the planting of new flammable conifer shrubs next to residences. Even without much enforcement, such a bylaw can a) educate the public on FireSmart best practices, b) set the tone for FireSmart recognition at the local government scale, and c) be implemented for public infrastructure. All bylaws applicable to the RDCK and specifically to Electoral Area C were reviewed through a wildfire lens.

The lack of a bylaw regulating open burning across the RDCK was identified as a potential gap in the last CWPP. An open burning bylaw would have stricter provisions than fire bans set by the province, which local fire departments do not have the authority to enforce. The recommendation was not renewed in this plan as the RDCK and BCWS determined that a local burning bylaw would not be effective or feasible for the RDCK to enforce.

Part of the Development Considerations discipline is ensuring that all critical infrastructure (described in Section 3.3 and listed in Table 7) are constructed or retrofitted to a high FireSmart standard. Performing FireSmart Critical Infrastructure Assessments on all publicly owned infrastructure will help inform further mitigation actions by the RDCK. Creston Valley Fire Rescue hall(s) have not yet been assessed. Recommendations regarding planning and development are detailed in Table 1 in the Executive Summary.

5.4 CROSS-TRAINING AND FIRE DEPARTMENT RESOURCES

All staff and agency partners who are expected to participate in the development and implementation of this plan, or participate in a wildfire response and recovery, should be appropriately trained. This includes municipal Emergency Management staff, other municipal staff that could play a role in an Emergency Operations Center (EOC), and local fire departments.

Regular in-person cross-training between BCWS and structural fire crews can facilitate joint responses to interface wildfires. Crews are likely to work together and may want to use each other's equipment. The closest BCWS crews are in Nelson and Castlegar (about a 1.5-hour drive), which poses a barrier for cross-training, especially when local fire department members are volunteer or paid on call. Creston Fire Rescue cited a strong relationship with BCWS; crews have worked together on interface fires in the region and in April 2024 members from Creston Fire Rescue did a controlled burn training day with BCWS. Interagency meetings also take place semi-annually.

Local fire departments should maintain a level of wildland-specific training and equipment. Creston Fire Rescue indicated that their members are satisfactorily trained and have adequate wildland firefighting equipment. All members have SPP-WFF1 (Wildland Firefighter Level 1) and additional members have WFF-115 and ENGB courses. Table 16 lists the capacity, training level, wildland firefighting equipment, and deficiencies of fire departments that provide fire protection services in Electoral Area C.

Table 16. Capacity, training, and resources of fire departments in Electoral Area C.

Fire Department	Personnel	Wildland Training	Wildland Equipment
Creston Fire Rescue (with fire halls at Wynndel Lakeview and West Creston)	4 full time staff 50 paid on call	All members trained in WFF1 and SPP-115	Pumper 1250 gpm, Wildland skid unit 150 gpm and assessory equipment, wildland PPE 2 SPUs in Creston Valley

Water is one of the most important resources for fire suppression. The ability to quickly deliver water to a fire, even outside of fire-hydrant zones, is critical to effective response to an interface wildfire event. Fire hydrants are only located in Goat River Bottom (Erickson water system). Outside of these areas, fire departments would use a water tender to shuttle water to the fire from the nearest hydrant, standpipe, or natural water source. Creston Fire Rescue indicated that Kootenay River, which runs through the Electoral Area, is a reliable and accessible year-round water source, but that designated drafting sites should be established throughout the area.

The ability to quickly communicate key information on water sources during an interface fire event is critical. Software applications like 'I Am Responding' are used by some fire departments to map water sources (e.g., lake access points, standpipes, etc.). Maps are an easy way to share information with BCWS and other fire crews that may be assisting in an interface wildfire situation. It is recommended that local fire departments develop a simple response map showing roads, gates, any fuel-treated areas, and water access points to share with BCWS and/or other response agencies in the event of an interface fire. It can take time to communicate this type of detailed local knowledge, and time is a scarce resource during emergency. Therefore, any pre-planning that can be completed is worthwhile. Pre-planning is further discussed in Section 5.5.

See Table 1 in the Executive Summary for recommended action items that the RDCK can implement to create and continue to develop opportunities for cross-training and improve fire department resources.

5.5 INTERAGENCY COOPERATION

The goal of interagency cooperation is to approach wildfire resilience through a collaborative, multi-agency approach. This increases the ability of local governments to plan and respond to emergencies effectively. For a large regional district like the RDCK, interagency cooperation is especially crucial. Depending on location, regional district residents may identify more with a member municipality than they do with the regional district. The small amount of regional district-owned land also means that the activities of other land managers may have a stronger influence on the risk profile of a specific community than RDCK actions. Examples include fuel treatments under the Ministry of Forests or BC Parks Wildfire Risk Reduction programs, development on private land, and logging on Crown land. This is especially true in Electoral Area C, where the majority of land in the interface is privately-owned, and much of the area beyond this is within the Creston Valley Wildlife Management Area, or on Yaqan Nukiy Indian Reserve.

Engagement can be formal or informal and can take place through existing communication channels, or stand-alone committees. For the development of this CWRP, an informal, plan-level Community FireSmart Resiliency Committee (CFRC) was formed with membership from the RDCK, local fire departments, and BC Wildfire Service. Individuals were contacted to answer questions relating to this plan.

Electoral Area C is represented by both a regional and sub-regional FireSmart Committee. The Creston Valley has an active Community FireSmart Resiliency Committee with membership from the RDCK, local fire chiefs, and community stakeholders. One member from Creston Valley's CFRC also sits on the Regional Wildfire Planning Table. The Planning Table includes local government representatives and provincial land managers and response agencies, including the Ministry of Forest, BC Parks, BCWS, and FNESS. The RDCK noted the benefits of both regional and sub-regional committees to achieve different objectives, while striking a balance between staff availability and local knowledge sharing.

External land-based stakeholders, such as utility providers and local forest licensees, are also an important component of interagency cooperation. According to BCWS, forest industry compliance with the Wildfire Act regarding slash hazard mitigation and open burning prohibitions are good. Likewise, no problems with utility or road rights-of-way maintenance within the plan area were specifically identified. BCWS also works with local companies to source heavy equipment, low beds, and equipment operators for potential wildfire response. These agreements are usually arranged on a contractual basis with the fire zone.

See Table 1 in the Executive Summary for recommended action items that the RDCK can implement to continue growing interagency relations and increase interagency cooperation.

5.6 EMERGENCY PLANNING

When several wildfire emergencies are taking place throughout the province, BCWS resource availability may become scarce. Deployment of provincial resources occurs based on the Provincial Coordination Plan for Wildland Urban Interface Fires.³⁶ Therefore, local government and community preparedness and resource availability are critical components of community wildfire resilience – individuals and agencies need to be ready to act. Plans, mutual aid agreements, resources, training, and emergency communications systems make for effective wildfire response. Emergency planning is provided by the RDCK Emergency Management Program, which includes all Electoral Areas and several participating municipalities (see Section 2.1).

Clear, consistent, concise, and quick communication during an emergency event and evacuation are integral to the prevention of loss of life. The RDCK has upgraded to a new notification system for emergency alerts and water advisories powered by “Voyent Alert!”. Downloadable as an app to a smart phone, the user can receive a detailed map of the affected area. The system also supports text messaging,

³⁶ Province of British Columbia. 2016. *Provincial Coordination Plan for Wildland Urban Interface Fires*. 2016. Retrieved from: https://www2.gov.bc.ca/assets/gov/public-safety-and-emergency-services/emergency-preparedness-response-recovery/provincial-emergency-planning/bc-provincial-coord-plan-for-wuifire_revised_july_2016.pdf

emails, or landline calls. The RDCK should promote this notification system to residents as much as possible.

Emergency events are not uncommon in the RDCK and the regional EOC was particularly active in response to the 2024 wildfire season (Slocan Lake and Lavina Complexes). However undesirable it may be, exposure to interface wildfire events increases community resiliency by requiring local governments and residents to put their emergency plans into action. The RDCK maintains a well-trained staff and volunteer Emergency Social Services (ESS) team(s) and conducts emergency exercises annually.

Some of the complexities of interface wildfires in Electoral Area C include:

- Evacuation of livestock from farms;
- West Creston is single access-egress from West Creston Road off Highway 3;
- Some dead-end streets with steep grades, little turn-around room;
- Railways intersecting communities (e.g. Goat River Bottom), with the potential for some egress routes to be blocked by trains, and;
- Adjacency to rural forested land in Idaho State requiring coordination with the US Forest Service in a response scenario.

Pre-incident planning can help immensely with wildfire response. A pre-incident plan is a compilation of essential fire management information needed to save valuable time during fire suppression operations. Basic pre-incident wildfire plans have been developed for every Natural Resource District in BC. The Selkirk Resource District Fire Management Plan is a high-level plan to guide BCWS response based on known and mapped values, including human life and safety, critical infrastructure, high environmental and cultural values, and resource values.

The RDCK should consider working with BCWS Structural Protection Coordination Office and the Fire Chief's Association of BC to have a type of detailed pre-incident plan called a Structure Protection Community Assessment developed for communities in Electoral Area C with particular emergency planning complications – such as West Creston (single access-egress intermix neighbourhood close to the Canada-US border). These plans provide a) basic information on values at risk, available resources, and level of risk, and b) operational information usable by an Incident Management Team or Structural Protection Specialist including structure triage categories, safe zones, and resource requirements.

A vital component of emergency management is recovery. The RDCK provides recovery information on their emergency management webpage, including post-emergency hazard reports and an online Community Recovery Resource Hub was created. The RDCK also opened three in-person Resiliency Centers during the wildfire season to support community recovery.³⁷

Recommendations and action items that the RDCK can implement to continue productive and effective emergency planning are detailed in Table 1 in the Executive Summary.

³⁷<https://www.rdck.ca/information-bulletin-august-14-2024/>

5.7 VEGETATION MANAGEMENT AND OTHER FIRESMART ACTIVITIES

As discussed in Section 4.1, fuel is the only aspect of the fire behavior triangle that can be realistically modified to reduce wildfire threat. Fuel or vegetation management reduces potential wildfire intensity and ember, flame, and radiant heat exposure to people, structures, and other values through manipulation of both natural and cultivated vegetation within or adjacent to a community. A well-planned vegetation management strategy can greatly increase first responder safety, fire suppression effectiveness, and reduce damage to property and to values.

Vegetation management can largely be accomplished through two different activities:

1. **Residential FireSmart landscaping:** The removal, reduction, or conversion of flammable [landscaping] plants to create more fire-resistant areas in the FireSmart Immediate, Intermediate, and Extended Zones (i.e., the area within 30m of a structure; see Figure 10 below).
2. **Fuel management treatments:** The manipulation or reduction of living or dead forest and grassland fuels to reduce the rate of spread and head fire intensity and enhance likelihood of successful suppression.

Figure 10: FireSmart Home Ignition Zone

Residential FireSmart Landscaping

Although there is the potential for large-scale fuel management treatments on both public and private land in the WUI, it is highly recommended that the RDCK focus on a structures-out approach for vegetation management, in line with BCWS priorities. This means treating vegetation closest to structures first, before progressing outwards to complete fuel management in the interface and then at the landscape level. Thus, educating (see Section 5.2) and reducing barriers for residents to implement FireSmart landscaping should be the priority.

Some debris disposal opportunities exist for residents managing vegetation on their properties. Open burning is allowed outside of provincial fire bans. Yard debris can be dropped off for free at the Creston landfill during the months of April and October.³⁸

FireSmart landscaping is also an eligible activity under the RDCK FireSmart rebate program. Provided residents receive a FireSmart Home Assessment beforehand, they can apply to receive compensation for their personal hours and materials or hired contractors. Despite these options, providing more or additional debris disposal options may further incentivize FireSmart vegetation management. Examples include driveway chipping programs and support for communities organizing community clean-up days. Clean-up days are an example of a qualifying event under FireSmart Canada Neighbourhood Recognition program. The RDCK supports this program and also has a grant to compensate Neighbourhood Champions for their personal time working towards neighbourhood recognition. No communities in Electoral Area C have received recognition to date.

Fuel Management Treatments

Fuel treatment opportunities may be linear fuel breaks, polygon treatments for discrete areas, or broader forest interventions. The intent of establishing fuel treatments is to modify fire behaviour and should be designed to keep surface fires on the ground to avoid the establishment of more dangerous and uncontrollable crown fires. Fuel treatments can also provide anchor points to fire-fighting crews for suppression activities,³⁹ yet the application of appropriate suppression tactics in a timely manner with sufficient resources is essential for fuel treatments to be effective – fuel treatments adjacent to a home or property should not be considered a “fire break”. Thus, to increase the efficacy of fuel treatments, FireSmart standards should be applied on nearby private properties to structures and vegetation to reduce the risk of structure ignition. Fuel treatment units will also require periodic maintenance (e.g., brushing, prescribed burning, surface fuel cleanup) to retain their effectiveness.

Funding opportunities for fuel treatments on public land exist through the UBCM CRI FireSmart Community Funding and Supports (FCFS) program, the Crown Land Wildfire Risk Reduction (WRR) program (administered by the Ministry of Forests), the Forest Enhancement Society of BC, and the Columbia Basin Trust. Map 8 below shows proposed and completed fuel treatment units within the WUI.

³⁸ <https://www.rdck.ca/environmental-service/environmental-services/waste-recycling/household-hazardous-waste-round-up/yard-garden-waste-seasonal-free-tipping/>

³⁹ BC Wildfire Service. (2022). [2022 Fuel Management Prescription Guidance](#).

Between 2012 and 2024, approximately 114 ha of fuel treatments were prescribed and implemented in Electoral Area C, all in the Lakeview area (Table 17). Note that additional treatments may have been completed on private land and are not systematically tracked. Other areas may have treatments planned or in progress that are not yet part of public datasets.

It should be noted that recently the Regional Wildfire Planning Table used grant funding to build a pilot map dashboard of completed fuel treatments across the region. This dashboard is not currently available to the public, but if maintained, will serve as an excellent tool for both interagency collaboration and coordinated wildfire risk reduction work in the region.

Table 17. Prescribed and Completed Treatment Units in the WUI

Treatment Unit Name	Community	Year	Area (ha)	Comment
WR0001048	Lakeview	2019-2020	10.7	2024: Treated (Goat Mountain FSR; CCF-1 in 2017 CWPP)
WR0001173	Lakeview	2020-2021	17.9	2024: Treated (Goat Mountain FSR; CCF-1 in 2017 CWPP)
WR0001285	Lakeview	2020-2023	4.9	2024: Treated (Goat Mountain FSR; CCF-1 in 2017 CWPP)
WR0001300	Lakeview	2020-2023	13.3	2024: Treated (Goat Mountain FSR; CCF-1 in 2017 CWPP)
WR0001313	Lakeview	2020-2023	4.6	2024: Treated (Goat Mountain FSR; CCF-1 in 2017 CWPP)
WRR0001356	Lakeview	2020	3.8	2024: Treated / Harvested
WRR0001557	Lakeview	2022	13.7	2024: Treated / Harvested
WC100	Okell Creek	2012	28.4	2017: Maintenance (prune trees to 3m; reduce woody surface fuels; remove ingrowth since previous treatment) recommended 2024: No visit
WL104	Okell Creek	2012	16.5	2017: Maintenance (prune trees to 3m; reduce woody surface fuels; remove ingrowth since previous treatment) recommended 2024: No visit

A full reconnaissance of the WUI was not in the scope of this plan update, so most proposed treatment units (PTUs) are carried forwards from the 2017 plan and then clipped to the 1-km Eligible WUI or otherwise altered in minor ways. Using field notes and satellite imagery, features were removed or boundaries updated to exclude harvested or treated areas, or areas outside the WUI, and aligned to private property, roads, or other mapped features where possible. PTU boundaries are intended to show the shape, size, and location of strategic WRR areas but are not intended to be usable prescription boundaries. Additionally, identifying net-out areas was beyond the scope of this plan. Therefore, during

any future prescription development it is strongly recommended that contracts allow flexibility for contractors to prescribe differently shaped areas. PTUs are summarized in Table 18.

Canfor, Huscroft, and Creston Community Forest are the major forest licensees with tenure overlaps in Electoral Area C's WUI. Forest harvesting for timber objectives can act as a form of vegetation management. Forestry activities affect wildfire risk in the WUI, depending on factors like post-harvest slash clean up, pre-harvest stand hazard, and post-harvest stand structure. Harvesting across the AOI has created a heterogenous patchwork of forest stands with different fuel load characteristics. Generally, even aged second growth stands with a high loading of ladder fuel from stem exclusion processes present the highest fire threat. Selective harvest or commercial thinning may be a good candidate to achieve fuel reduction on a large and socially acceptable scale throughout the area, especially where visual impact is a concern. Interagency collaboration (see Section 5.5) will be key to achieving this scale of vegetation management.

Despite opportunities on public land, the most beneficial location for fuel management is on private land, due to proximity to values. Recommendations in Section 5.1 and 5.2 help address these gaps and this type of 'FireSmart Landscaping' is discussed above. But to have the most meaningful influence on the fuel component of the wildfire environment in Electoral Area C, creative solutions to incentivize forest treatment on private land even outside of the Home Ignition Zone (30 m buffer) may be required. Many properties in West Creston and Lakeview are over 1 hectare in size (100 m x 100 m) and are partly or fully forested. One recommendation is to work with the Ministry of Forests to consider a program or strategy to guide larger-scale forest treatments on private land. The Washington State Department of Natural Resources' Small Forest Landowner Regulation Assistance Program is a possible framework.

Vegetation management recommendations and action items are listed in Table 1 in the Executive Summary.

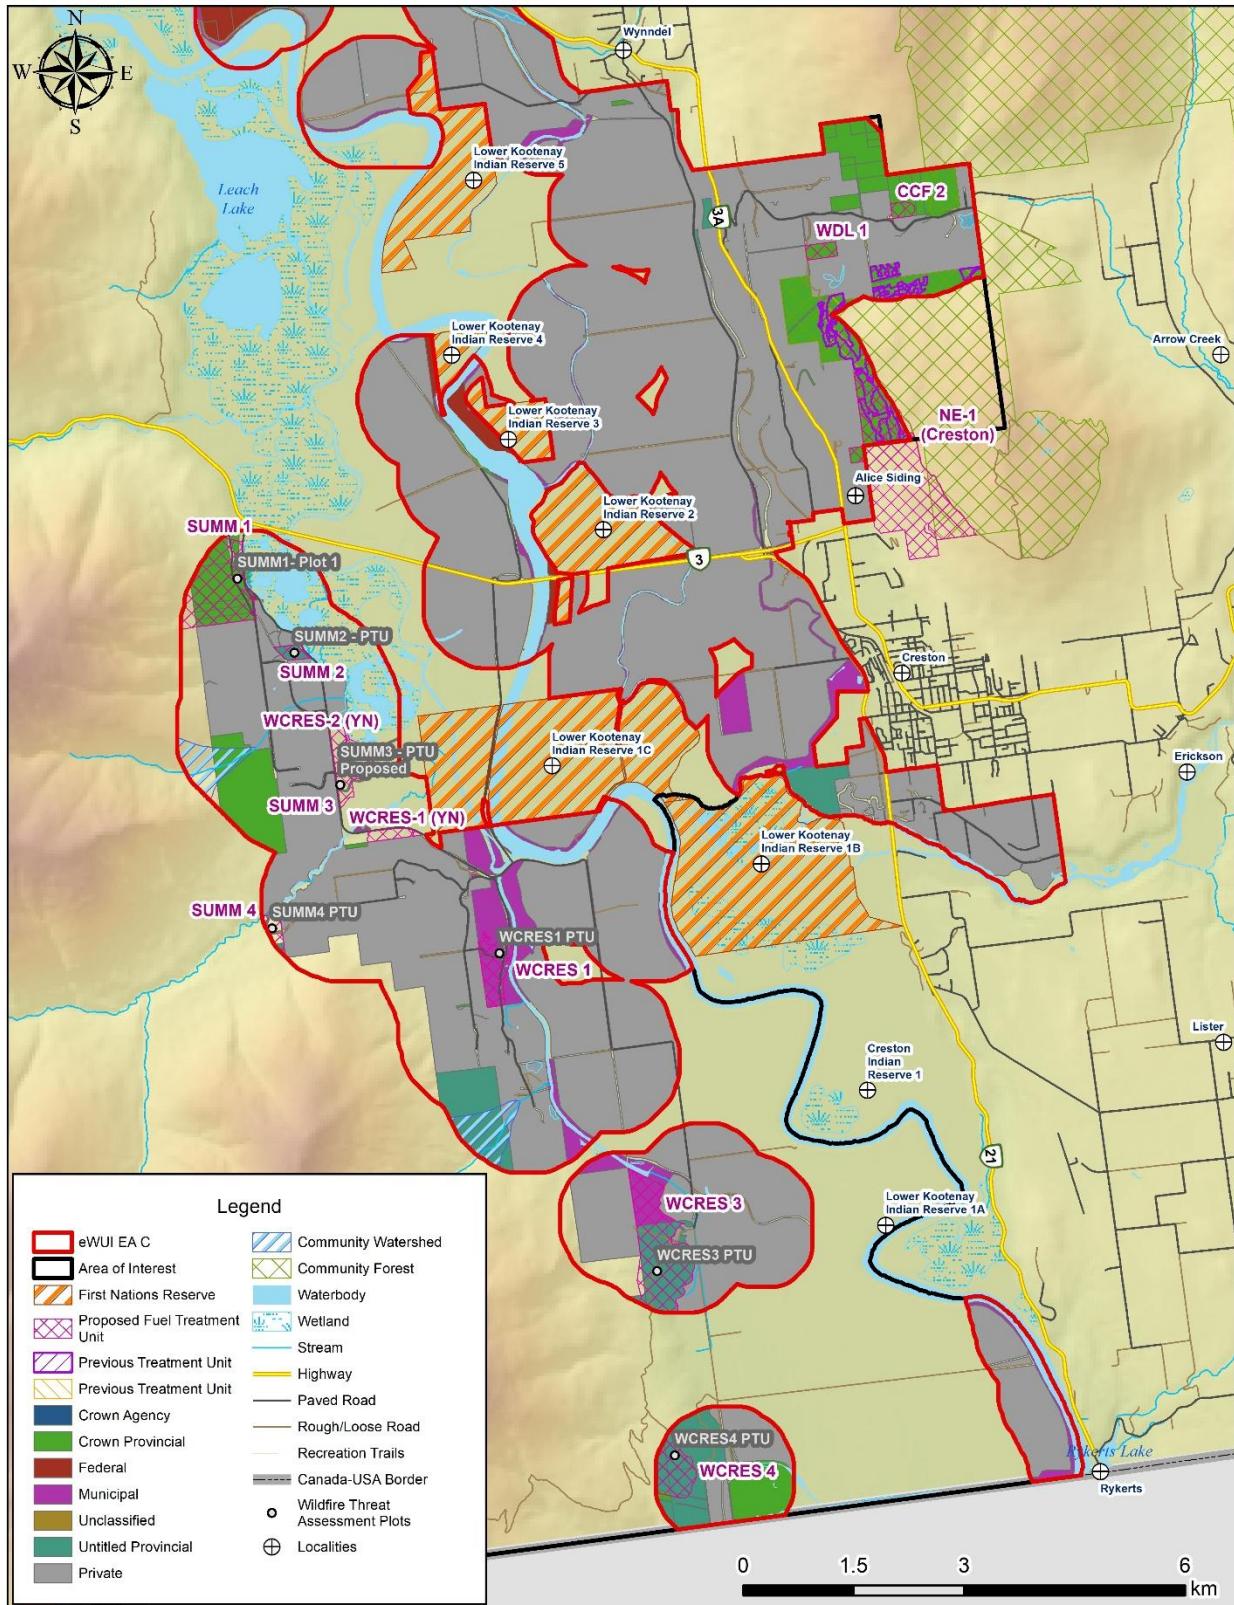

Table 18: Summary of Proposed Fuel Treatment Units

PTU Name	Priority	Area (ha)	Overlapping Values / Treatment Constraints	Treatment Rationale
CCF 2	Moderate		Entirely on Crown Provincial land. <100m to private property and adjacent to the Creston Valley Community Forest.	<p>***New PTU as of 2024 update***</p> <p>Treat to reduce wildfire threat within the WUI adjacent to private property.</p> <p>Composed of Fd dominant overstory with patches of Bg and Fd regeneration. There is low to moderate CWD. The trees are generally healthy. The treatment unit is easily accessible for machinery and adjacent to an FSR. As a result, the treatment regime lends itself to a commercial thin in machine accessible areas. In other areas, manual thin is more appropriate as the terrain is steep. In all areas, recommend pruning retained trees, and pile and burning ladder and surface fuels.</p>
NE-1A (Creston)	High	106.4	<p><i>FROM THE TOWN OF CRESTON 2023 CWRP:</i></p> <p>Municipal land portion and entirely within Creston's EWUI. Adjacent to private property on its south and west edges. Limited road access. Steep slopes.</p> <p>Within Creston Valley Community Forest tenure and overlap with RDCK Arrow Creek water system, as well as areas fuel treated in 2020, 2021, and 2023.</p>	<p><i>FROM THE CITY OF CRESTON 2023 CWRP:</i></p> <p>The Northeast treatment area encompasses the forested northeast of Creston's WUI. This area is dominated by C-7 fuel types with some M-1/2 in the lower slope (likely moisture receiving sites). The entire northeast WUI area is almost all High and Extreme wildfire behaviour threat due to the presence of conifer-dominated fuel types on steep, south and southwest facing slopes. Although all structure values are at the bottom of the slope and prevailing fire season winds are from the southwest (moving a fire uphill away from the community), the potential wildfire behaviour if a fire is in this slope should not be ignored. At the edge of the WUI, the Creston Community Forest has completed recent harvesting – this breaks up the continuity of the fuel environment, but reduced slash management should be considered. With the harvesting, a forest road conveniently runs practically across the entire northeast edge of the WUI. This road can be used as a backstop for possible prescribed/cultural burning, if assessed as practicable (hence the inclusion of a small area outside of the WUI). The identified sub-polygons are to describe differing land ownership/land managers within this treatment area, which may equate to differing funding sources for prescription development and treatment implementation. High priority was given to those land ownership areas that directly interface with properties and structures.</p> <p>This area is identified as a Proposed Treatment Area. To achieve the intent of a landscape-level area of reduced wildfire behaviour threat, many areas of the Northeast Treatment Area will likely have some form of fuel management risk reduction completed in them – the type and amount will vary throughout the Treatment Area due to the differing fuel types present and treatment constraints within it. The finer-scale process of prescription development field work will identify Treatment Units and should then prioritize them for implementation by assessed risk and strategic importance. As mentioned previously, the road across the top of the entire Treatment Area makes it possible to support prescribed/cultural burning.</p>

PTU Name	Priority	Area (ha)	Overlapping Values / Treatment Constraints	Treatment Rationale
				Overall, the fuel management treatments anticipated will include the reduction of ladder fuels through thinning understory conifers, crown separation of overstory conifers through spacing, raising of the effective crown base heights of retained overstory conifers through pruning, and the reduction of surface fuels (can be through both/either pile and burning and prescribed/cultural burning).
SUMM 1	Moderate	84.6	Entirely on Crown Provincial land within RDCK Electoral Area C. Almost complete overlap with Creston Valley Wildlife Management Area and <100m from private property.	***PTU existing from 2017 (Boundaries have been adjusted)*** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of open Fd Py overstory with some patches of dense Fd overstorey and thick Fd understorey. As a result, the treatment regime lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.
SUMM 2	Moderate	6.7	Entirely on Crown Provincial land within RDCK Electoral Area C. <100m from private property with public roads on all sides.	***New PTU as of 2024 update*** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of well-spaced Fd and Lw overstorey stems with some dead standing. The treatment unit has a thick understorey of Fd with moderate crown base height. The treatment unit is bordered by properties on 3 sides so there will be high visibility for the public. As a result, the treatment regime lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.
SUMM 3	Moderate	20.5	Entirely on Crown Provincial land within RDCK Electoral Area C. <100m from private property. Complete overlap with Creston Valley Wildlife Management Area.	***New PTU as of 2024 update*** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of Hw, Cw, Lw overstory and Cw, Hw understorey with high amount of elevated ladder and surface fuels. The treatment unit appears to be contained within a wildlife reserve. As a result, the treatment regime lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.
SUMM 4	Moderate	9.3	Entirely on Crown Provincial land within RDCK Electoral Area C. Private property is 500m away and has a heavily used FSR going through it	***New PTU as of 2024 update*** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of well-spaced Lw, Py, Hw and Cw with Cw, Hw, Py understorey. The treatment unit has moderate elevated ladder fuels. As a result, the treatment regime lends itself to a commercial thin in machine accessible areas. In other areas, manual thin is more appropriate as the terrain is steep. In all areas, recommend pruning retained trees, and pile and burning ladder and surface fuels.
WCRES 1	Moderate	30.3	On municipal land – RDCK. Trail to waterfall. <100m from private property.	***PTU existing from 2017. Include in 2024 update** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of Cw, Hw overstory with large patches of deciduous with Cw primarily around creek draw and an area of Cw. The treatment unit has moderate elevated ladder fuels. As a result, the treatment regime

PTU Name	Priority	Area (ha)	Overlapping Values / Treatment Constraints	Treatment Rationale
				lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.
WCRES-1 (YN)	Low	8.3	<p><i>FROM YAQAN NUKIY CWRP 2023:</i> Entirely on Crown Provincial land. Private land borders the south edge of the PTU. The north edge borders W Creston Road.</p>	<p><i>FROM YAQAN NUKIY CWRP 2023:</i> To reduce wildfire behaviour and along the main access/egress route (W. Creston Road), treatments should focus on removing most understory stems and reducing surface fuel. The WCRES-1 PTU mainly features M1/2 (75% conifer) fuel type due to abundant western larch, with patches of C-3 fuel type where larch is less common. There is potential for commercial thinning of small diameter cedar overstory stems.</p>
WCRES-2 (YN)	Low	14.4	<p><i>FROM YAQAN NUKIY CWRP 2023:</i> On Crown Provincial land, complete overlap with Creston Valley Wildlife Management Area. Adjacent to SUMM 3 on W edge.</p>	<p><i>FROM YAQAN NUKIY CWRP 2023:</i> To reduce wildfire behavior in yaqan nukiy's WUI, and to lower the threat along the main access/egress route (W. Creston Road), it is recommended to remove elevated dead/downed wood ("jack-pots") and reduce surface fuels. The WCRES-2 PTU, characterized by M1/2 fuel type due to >20% western larch overstory. Treatment regime lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.</p>
WCRES 3	Moderate	100	Entirely on Crown Provincial land within RDCK Electoral Area C. <150m from private property. Small overlap with UREP 027014. Northern end overlaps RDCK municipal land.	<p>***PTU existing from 2017 (Boundaries may have been adjusted)*** Composed of Hw, Cw, Lw overstory and Cw, Hw understory with high amount of elevated ladder and surface fuels. Treatment regime lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.</p>
WCRES 4	Moderate	33.9	Entirely on Crown Provincial land within RDCK Electoral Area C. <150m from private property.	<p>***PTU existing from 2017 (Boundaries have been adjusted)*** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of Hw, Cw and Lw with a dense understory of CW and HW. The treatment unit has moderate amounts of ladder and surface fuel. The treatment unit has an extensive network of ATV and dirt bike trails with evidence of substantial use. As a result, the treatment regime lends itself towards a non-commercial thin, pruning retained trees, and pile and burning ladder and surface fuels.</p>
WDL 1	High	8.4	Entirely on Crown Provincial land. Adjacent to private property	<p>***New PTU as of 2024 update*** Treat to reduce wildfire threat within the WUI adjacent to private property. Composed of large diameter Bg, FD, Cw and Hw with signs of decay, a high amount of CWD and a moderate to high amount of ladder fuels. There is evidence of previous logging. The treatment unit is surrounded by private land and homes on all sides and has gentle terrain, accessible for machinery. As a result, the treatment regime lends itself to a commercial thin in machine accessible areas. In other areas,</p>

PTU Name	Priority	Area (ha)	Overlapping Values / Treatment Constraints	Treatment Rationale
				manual thin is more appropriate as the terrain is steep. In all areas, recommend pruning retained trees, and pile and burning ladder and surface fuels.

Map 8: Overview map of prescribed, completed and proposed fuel treatment units within the WUI.

SECTION 6: FIRESMART ROADMAP AND CWRP ACTION PLAN

6.1 FIRESMART ROADMAP

The FireSmart Roadmap (see Figure 11 below) is a concept that visually demonstrates how no two communities will follow the same path towards increased community wildfire resiliency, but that actions progress along four sequential phases. Some activities, including education, may appear in multiple phases but should reflect progression in terms of the community's understanding and adoption of FireSmart principles.⁴⁰

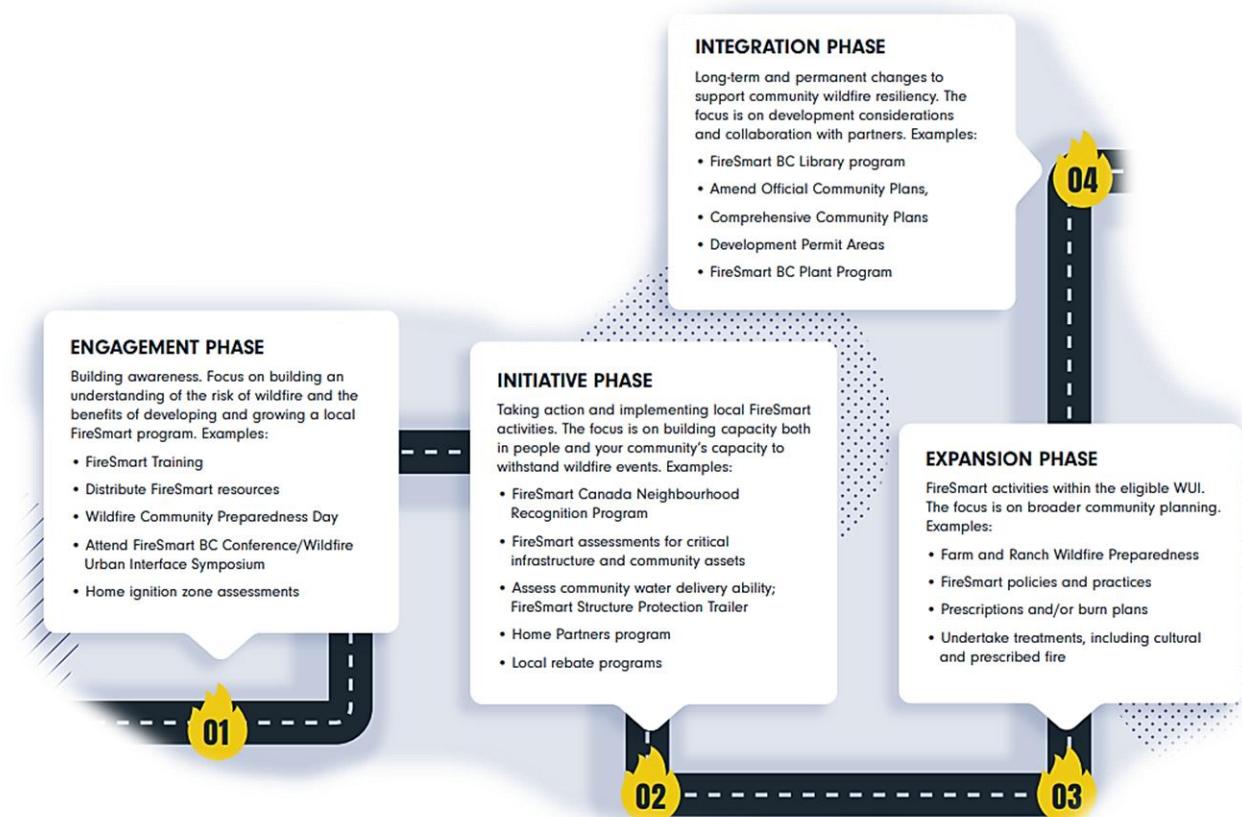

Figure 11. Graphic representation of the FireSmart Roadmap concept.⁴¹

⁴⁰ Community Resiliency Investment. 2023. *FireSmart Community Funding and Supports Supplemental Instruction Guide*. Retrieved from: <https://www.ubcm.ca/funding-programs/local-government-program-services/community-resiliency-investment/firesmart-0>

⁴¹ Copied from FireSmart BC – The FireSmart Roadmap. <https://firesmartbc.ca/resource/the-firesmart-roadmap/>

Prior to the first phase, FireSmart BC recommends that three foundational elements are in place:

- A FireSmart Position
- A Community Wildfire Resiliency Plan
- A Community FireSmart Resiliency Committee (CFRC), or participation in one

The RDCK has all three elements in place and is engaging in late-stage activities on the Roadmap, such as fuel treatments, the FireSmart BC Library program, and Development Permit Areas. Table 1 in the Executive Summary details the Action Plan for the RDCK. Each Action Item is a prioritized recommendation supported with a rationale, suggested lead agency, expected timeframe, resources required (funding, staff capacity), and metric for success.

6.2 TRACKING, REPORTING, AND UPDATES

As the RDCK works towards implementation of this plan, consider scheduling an annual review of progress made towards each action item/recommendation. Tracking and reporting will create accountability and also help with future funding applications. Consider reporting accomplishments and successes of the FireSmart program (for example, number of members trained, number of assessments completed) in a brief annual report that can be shared with the public, and serve to further FireSmart engagement.

The RDCK should prepare for a five-year comprehensive review/update of the entire plan. A current CWRP (typically 5 years or less) is presently a requirement of the FCFS program. The update should review the entire plan and consider how risk has changed based on any recent wildfires, vegetation management works completed, substantial changes to the built environment due to growth and development, economic changes, or other factors that would influence the overall success of the plan. This would also include a detailed analysis of all completed fuel management treatments within the planning area with an updated status and/or a maintenance plan.

APPENDIX A: REVIEW OF 2017 CWPP RECOMMENDATIONS

Item	Priority .	2019 CWPP Recommendation	2024 CWRP <i>Follow-Up Discussion</i>
Communication and Education			
Objective: To improve public understanding of fire risk and personal responsibility by increasing resident awareness of the wildfire threat in their community and to establish a sense of homeowner responsibility.			
1	High	Establish a school education program to engage youth in wildfire management. Consult ABCFP, BCWS (the zone) and RDCK Fire Service to facilitate and recruit volunteer teachers and experts to help with curriculum development to be delivered in elementary and/or secondary schools. Educational programming can be done in conjunction with any currently running fire prevention education programs.	This has not been done.
2	High	Make summaries of this report and associated maps publicly available through webpage, social media, and public FireSmart meetings. Add fire threat spatial data to the interactive web-mapping tool to allow residents to find their property and the associated threat of wildfire.	The CWPP was posted on the RDCK website. Fire threat spatial data is not currently available on the RDCK public webmap.
3	Moderate	Participate in the National Wildfire Community Preparedness Day, typically in May each year.	The RDCK Participates in this
4	High	Expand door-to-door FireSmart assessment and/or Home Partner Program within the Area C interface to educate residents and to quantify the level of risk in the interface.	This has been expanded successfully
Objective: To enhance the awareness of elected officials and stakeholders regarding the resources required to reduce fire risk.			
5	High	Develop regional development permit standards and align local government bylaws.	As per the response in the questionnaire
6	High	Provide a group voice to the Building and Safety Standards Branch and other provincial entities.	There has been some limited work done on this; however this needs provincial leadership
7	High	Develop a coordinated approach to fuel management and hazard reduction within and adjacent to Area C by coordinating with stakeholders including conservation organizations, communities, forest licensees, Ministry of Transportation and Infrastructure and utility companies, to aid in the establishment of FireSmart activities and large, landscape-level fuel breaks or compliment current or proposed fuel treatment areas.	Some collaboration has occurred
Structure Protection and Planning			

Item	Priority .	2019 CWPP Recommendation	2024 CWRP <i>Follow-Up Discussion</i>
Communication and Education			
Objective: Enhance protection of critical infrastructure from wildfire.			
8	High	Complete a fire flow / water vulnerability assessment for each water system and identify and map all alternative water sources (reservoirs, streams, lakes, etc.). Identify which areas may have insufficient or unreliable water supplies and provide recommendations to reduce vulnerability in Area C. Explore collaboration with other agencies including Columbia Basin Trust, Ministry of Environment, Ministry of Transportation and Infrastructure and Interior Health Authority.	This has not occurred
9	High	Complete a vulnerability assessment of all critical infrastructure (not only RDCK critical infrastructure) including water infrastructure in interface areas with FireSmart recommendations.	This has not occurred
10	High	Develop alternative, back-up water sources for fire protection, and the establishment of standpipes as required.	This has not occurred
11	High	Complete a detailed review of back-up power source options for all critical infrastructure and upgrade as required.	This has not occurred
12	High	Complete more detailed hazard assessments and developing, in collaboration with other available government funding, response plans for stabilization and rehabilitation of burn areas in watersheds that are vulnerable to post-wildfire debris flows and floods.	The completion of hazard assessments and rehab of burns areas is provincial responsibility. The RDCK does conduct further hazard assessments where there is a public safety risk
Objective: Encourage private homeowners to voluntarily adopt FireSmart principles on their properties.			
13	High	Support homeowners with professionals to provide the Home Partners Program or WUI Site and Structure Hazard Assessments for interface homes and provide information to homeowners on specific steps that they can take to reduce fire hazards on their property. Homeowners should not be charged for these assessments.	This program is being delivered
Local Government Policy			
Objective: To reduce wildfire hazard on private land and increase FireSmart compliance.			
14	High	Complete OCP review and implement and / or strengthen zoning to expand reach of the existing.	Not as it pertains to wildfire

Item	Priority .	2019 CWPP Recommendation	2024 CWRP <i>Follow-Up Discussion</i>
Communication and Education			
15	High	Develop Wildfire Hazard Development Permit (DP) Areas for major retrofits / renovations or new builds (building permits), collecting bonds to be returned upon evidence of completing development and landscaping according to wildfire hazard assessment. Review District of North Vancouver and Kelowna DP processes, with particular attention to implementation, enforcement, affordability and associated liabilities. Explore proactive incentives, such as tax reductions and reduced building permit fees.	As per the questionnaire response
16	High	Obtain legal advice regarding the Building Act, specifically regarding the temporarily unrestricted matters and local government authority to set exterior building materials requirements. Use local government authority to mandate FireSmart construction materials beyond BC Building Code in wildfire hazard development permit area, as allowed.	
17	High	Develop a landscaping standard to be applied in interface / DP areas. The standard should list flammable non-compliant vegetation, nonflammable drought and pest resistant alternatives, and tips on landscape design to reduce maintenance, watering requirements, and reduce wildfire hazard. Include meeting landscaping standard as a requirement of Development Permit. Review District of North Vancouver and Kelowna DP processes, with particular attention to implementation, enforcement, affordability and associated liabilities. Explore proactive incentives, such as tax reductions and reduced building permit fees.	As per the questionnaire response
18	High	Proactively enforce wildfire covenants requiring owners to maintain their properties hazard free on all properties in Development Permit areas. Enforcement will serve to minimize fuel risks on problematic private properties that have allowed hazardous accumulation of fuels and provide improved protection to adjacent lands.	No
19	High	Develop a landscaping standard to be applied in interface / DP areas to ensure that developers leave building setbacks on private land so that there is a minimum of 10 m distance between buildings and forest interface.	No
20	High	Consider developing an outdoor burning bylaw specifying requirements for and limitations to outdoor burning and, in conjunction with the Fire Chief, implement the bylaw at times of high fire danger when provincial bans are not in place. The bylaw should consider effective and efficient enforcement measures and powers.	This has not been applied in the rural electoral area. In consultation with BC Wildfire it has not been deemed feasible or effective to do this.
21	Moderate	Work with the Building and Safety Standards Branch to provide input into the Building Code revisions that would apply within the interface to prevent the spread of wildfire.	No

Item	Priority .	2019 CWPP Recommendation	2024 CWRP <i>Follow-Up Discussion</i>
Communication and Education			
	Emergency Response and Planning		
Objective: To improve structural and wildfire equipment and training available to RDCK Fire and Rescue.			
22	High	Conduct annual mutual aid training with MFLNRORD and BCWS including completion of a mock wildfire simulation in coordination with BCWS and safety training specific to wildland fire and risks inherent with natural areas. As part of the training, conduct annual reviews to ensure PPE and wildland equipment resources are complete, in working order, and the crews are well versed in their set-up and use. Wildfire training should follow Office of the Fire Commissioner standards.	This occurs annually
23	High	Ensure RDCK Wildfire Mitigation Coordinator act as liaison between the RDCK Collaborative Planning Group and the Emergency Preparedness Committee for Area C. Coordination and information sharing are crucial to the development of a community well prepared for wildfire.	There is collaboration on this within the emergency program
24	Moderate	Review and clarify SPU request procedures with RDCK fire Chiefs and ensure robust SPP115 training for fire fighters.	This is in place
25	Moderate	Develop Regional Service to fund additional SPUs and maintain existing SPUs.	This is in place
26	Moderate	Explore opportunities to collaborate with BCWS and within RDCK fire service to coordinate discount volumes of hose for interface fires, reducing costs and logistics to local fire departments	This has not been explored
27	High	Explore opportunities to ensure a duty officer is in place in each Fire Protection Area to provide coverage for periods of high or extreme hazard.	There is a 24/7 Regional Duty Officer
28	Moderate	Conduct fire preplan assessment for key interface areas in Area C. Other jurisdictions have completed assessments that prioritize fire department-specific variables, such as distance to hydrants, response time from nearest fire station, etc. to produce local risk ratings.	Some assessments have been completed
	Emergency Response Evacuation and Access		
Objective: To improve access and egress to neighbourhoods at risk and natural areas within RDCK.			

Item	Priority .	2019 CWPP Recommendation	2024 CWRP Follow-Up Discussion
Communication and Education			
29	High	Develop a Total Access Plan to create, map and inventory trail and road network in natural areas for suppression planning, identification of areas with insufficient access and to aid in strategic planning. Fire threat mapping from this CWPP should be included. The plan should be updated every five years, or more regularly, as needed to incorporate additions or changes.	This has not been done
30	High	Require that all new interface developments have access for evacuation and sufficient capacity for emergency vehicles.	As per the Questionnaire
31	Moderate	Facilitate completion of emergency planning zones for interface neighbourhoods with limited access	This has not been done
	Fuel Management		
Objective: Reduce wildfire threat on public lands through fuel management.			
32	High	Proceed with detailed assessment, prescription development and treatment of hazardous fuel units identified in this CWPP. Collaboration with licensees may facilitate larger projects.	Some prescription work has been completed.
33	High	Prioritize Areas of Interest across Electoral Areas with updated CWPPs to ensure effective and objective treatment	Some prioritization has been done
Objective: Maintain treated areas under an acceptable level of wildfire fire threat (moderate).			
34	Moderate	As treatments are implemented, complete monitoring within 10 years of treatment (subject to site conditions) and maintenance every 15-20 years (subject to prescription and site conditions) on previously treated areas. Treated areas should be assessed by a Registered Professional Forester, specific to actions required to maintain treated areas in a moderate or lower hazard.	There has been no assessment for re treatment

APPENDIX B: LOCAL WILDFIRE RISK PROCESS

Wildfire Risk Assessment plot worksheets are provided in Appendix C (separate PDF package) and the field data collection and spatial analysis methodology is detailed in Appendix B-2 and B-3.

APPENDIX B-1: FUEL TYPING METHODOLOGY AND LIMITATIONS

The Canadian Forest Fire Behaviour Prediction (FBP) System outlines five major fuel groups, and sixteen fuel types based on characteristic fire behaviour under defined conditions.⁴² Fuel typing is recognized as a blend of art and science. Although a subjective process, the most appropriate fuel type was assigned based on research, experience, and practical knowledge; this system has been used within BC, with continual improvement and refinement, for 20 years.⁴³ It should be noted that there are substantial limitations with the fuel typing system which should be recognized. Major limitations include: a fuel typing system designed to describe fuels which sometimes do not occur within the WUI, fuel types which cannot accurately capture the natural variability within a polygon, and limitations in the data used to create initial fuel types.⁴³ There are several implications of these limitations, which include: fuel typing further from the developed areas of the study has a lower confidence, generally; and, fuel typing should be used as a starting point for more detailed assessments and as an indicator of overall wildfire risk, not as an operational, or site-level, assessment. Forested ecosystems are dynamic and change over time: fuels accumulate, stands fill in with regeneration, and forest health outbreaks occur. Regular monitoring of fuel types and wildfire risk assessment should occur every 5 – 10 years to determine the need for threat assessment updates and the timing for their implementation.

Fuel types were not updated for this CWRP. Fuel types from the 2017 CWPP were used. Where there were new areas of WUI that did not exist in 2017, the PSTA fuel type data was used.

⁴² Forestry Canada Fire Danger Group. 1992. Development and Structure of the Canadian Forest Fire Behavior Prediction System: Information Report ST-X-3.

⁴³ Perrakis, D.B., Eade G., and Hicks, D. 2018. Natural Resources Canada. Canadian Forest Service. *British Columbia Wildfire Fuel Typing and Fuel Type Layer Description 2018 Version*.

APPENDIX B-2: WILDFIRE THREAT ASSESSMENT PLOTS

Table 19 displays a summary of all Wildfire Threat Assessment (WTA) plots completed during CWRP field work. WTAs were completed only to support the fuel treatment unit updates. The most recent 2020 WTA threat plot worksheets and methodology were used.⁴⁴ The plot forms and photos will be submitted as a separate document. The following ratings are applied to applicable point ranges:

- Wildfire Behaviour Threat Score (Coast and Mountains Ecoprovince)
 - 0 – 41 Low
 - 42 – 57 Moderate
 - 58 – 69 High
 - 70 – 100 Extreme

Table 19. Summary of WUI Threat Assessment Worksheets (2020).

WTA Plot	Geographic Location	Wildfire Threat Rating
CCF2	Lakeview Arrow Creek Road	Moderate
SUMM1	West Creston Road	Moderate
SUMM2	West Creston Road	Moderate
SUMM3	West Creston Road	Moderate

⁴⁴ MFLNRORD.2020 Wildfire Threat Assessment Guide and Worksheets

APPENDIX B-3: FIRE RISK THREAT ASSESSMENT METHODOLOGY

The Wildfire Threat Assessment Methodology used in the development of the 2017 Electoral Area C CWPP was as follows:

As part of the CWRP process, spatial data submissions are required to meet the defined standards in the Program and Application Guide. Proponents completing a CWRP can obtain open-source BC Wildfire datasets, including Provincial Strategic Threat Analysis (PSTA) datasets from the British Columbia Data Catalogue. Wildfire spatial datasets obtained through the BC Open Data Catalogue used in the development of the CWRP include, but are not limited to:

- PSTA Spotting Impact
- PSTA Fire Density
- PSTA Fire Threat Rating
- PSTA Lighting Fire Density
- PSTA Human Fire Density
- Head Fire Intensity
- WUI Human Interface Buffer (1436m buffer from structure point data)
- Wildland Urban Interface Risk Class
- Current Fire Polygons
- Current Fire Locations
- Historical Fire Perimeters
- Historical Fire Incident Locations
- Historical Fire Burn Severity
- Fuel Type
- Eligible WUI (1 km buffer of structure density classes >6).

The required components for the spatial data submission are detailed in the Program and Application Guide Spatial Appendix – these include:

- AOI
- Proposed Treatment
- WUI (1 km buffer of structure density classes >6)

The provided PSTA data does not transfer directly into the geodatabase for submission, and several PSTA feature classes require extensive updating or correction. In addition, the Fire Threat determined in the PSTA is fundamentally different than the localized Fire Threat feature class that is included in the Local Fire Risk map required for project submission. The Fire Threat in the PSTA is based on provincial scale inputs - fire density; spotting impact; and head fire intensity, while the spatial submission Fire Threat is based on the components of the Wildland Urban Interface Threat Assessment Worksheet. For the scope

of this project, completion of updated WTA Threat Assessment plots on the entire AOI was not possible, and therefore the output of the analytical model used in 2017 was clipped to the 1-km WUI for this CWRP update. The model was built to assume Fire Threat based on spatially explicit variables that correspond to the WTA Threat Assessment worksheets.

Field Data Collection

The primary goals of field data collection are to confirm or correct the provincial fuel type, complete WUI Threat Assessment Plots, and assess other features of interest to the development of the CWRP. This is accomplished by traversing as much of the AOI and surrounding Eligible WUI as possible (within time, budget and access constraints). Threat Assessment plots are completed on the most recent form, and as per the Wildfire Threat Assessment Guide.

For clarity, the final threat ratings for the AOI were determined through the completion of the following methodological steps:

1. Update fuel-typing using orthophotography provided by the client and field verification.
2. Update structural data using critical infrastructure information provided by the client, field visits to confirm structure additions or deletions, BC Assessment, and orthophotography
3. Complete field work to ground-truth fuel typing and threat ratings (completed 8 WUI threat plots on a variety of fuel types, aspects, and slopes and an additional 250 field stops with qualitative notes, fuel type verification, and/or photographs)
4. Threat assessment analysis using field data collected and rating results of WUI threat plots – see next section.

Spatial Analysis

The field data is used to correct the fuel type polygon attributes provided in the PSTA. This corrected fuel type layer is then used as part of the spatial analysis process. The other components are developed using spatial data (BEC zone, fire history zone) or spatial analysis (aspect, slope). A scoring system was developed to categorize resultant polygons as having relatively low, moderate, high or extreme Fire Threat, or Low, Moderate, High or Extreme WUI Threat. Table 20 below summarizes the components and scores to determine the Fire Behaviour Threat.

Table 20: Components of Fire Threat Analysis

Attribute	Indicator	Score
Fuel Type	C-1	35
	C-2	
	C-3	
	C-4	
	M-3/4,>50% dead fir	20
	M-1/2, >50% conifer	
	C-7	
	M-3/4, <50% dead fir	
	O-1a/b	10
	S-1	

Attribute	Indicator	Score
Weather - BEC Zone	S-2	5
	S-3	
	M-1/2, <50% conifer	
	C-5	
	C-6	
	D-1/2	
	W	
	N	
Historical Fire Occurrence Zone	AT, irrigated	1
	CWH, CDF, MH	3
	ICH, SBS, ESSF	7
	IDF, MS, SBPS, CWHsds1 & ds2, BWBS, SWB	10
	PP, BG	15
Slope	G5, R1, R2, G6, V5, R9, V9, V3, R5, R8, V7	1
	G3, G8, R3, R4, V6, G1, G9, V8	5
	G7, C5, G4, C4, V1, C1, N6	8
	K1, K5, K3, C2, C3, N5, K6, N4, K7, N2	10
	N7, K4	15
Aspect (>15% slope)	<16	1
	16-29 (max N slopes)	5
	30-44	10
	45-54	12
	>55	15
	North	0
	East	5
	<16% slope, all aspect	10
	West	12
	South	15

These attributes are summed to produce polygons with a final Fire Behavior Threat Score. To determine the WUI Risk score, only the distance to structures is used. Buffer distance classes are determined; <200m, 200m-500m and >500m) but only for polygons that had a 'high' or 'extreme' Fire Threat score from previous assessment. In order to determine WUI Risk; those aforementioned polygons within 200m are rated as 'extreme', within 500m are rated as 'high', within 2km are 'moderate', and distances over that are rated 'low'.

Limitations

There are obvious limitations in this method, most notably that not all components of the threat assessment worksheet are scalable to a GIS model, generalizing the Fire Behaviour Threat score. The WUI Risk Score is greatly simplified, as determining the position of structures on a slope, the type of development and the relative position are difficult in an automated GIS process. Structures are considered, but there is no consideration for structure type (also not included on threat assessment worksheet). This method uses the best available information to produce accurate and useable threat assessment across the study Area in a format which is required by the UBCM FCFS program.

APPENDIX B-4: PROXIMITY OF FUEL TO THE COMMUNITY

The correlation between structure loss and wildfire are described below.

Home and Critical Infrastructure Ignition Zones

Multiple studies have shown that the principal factors regarding home and structure loss to wildfire are the structure's characteristics and immediate surroundings. The area that determines the ignition potential of a structure to wildfire is referred to as (for residences) the Home Ignition Zone (HIZ) or (for critical infrastructure) the Critical Infrastructure Ignition Zone (CIIZ).^{45,46} Both the HIZ and CIIZ include the structure itself and three concentric, progressively wider Priority Zones out to 30 m from the structure. More details on priority zones can be found in the FireSmart Manual.⁴⁷

It has been found that during extreme wildfire events, most home destruction has been a result of low-intensity surface fire flame exposures, usually ignited by embers. Firebrands can be transported long distances ahead of the wildfire, across fire guards and fuel breaks, and accumulate within the HIZ in densities that can exceed 600 embers per square meter. Combustible materials found within the HIZ combine to provide fire pathways allowing spot surface fires ignited by embers to spread and carry flames or smoldering fire into contact with structures.

Because ignitability of the HIZ is the main factor driving structure loss, the intensity and rate of spread of wildland fires beyond the community has not been found to necessarily correspond to loss potential. For example, FireSmart homes with low ignitability may survive high-intensity fires, whereas highly ignitable homes may be destroyed during lower intensity surface fire events.⁴⁶ Increasing ignition resistance would reduce the number of homes simultaneously on fire; extreme wildfire conditions do not necessarily result

in WUI fire disasters.⁴⁸ It is for this reason that the key to reducing WUI fire structure loss is to reduce structure ignitability. Mitigation responsibility must be centered on structure owners. Risk communication, education on the range of available activities, and prioritization of activities should help homeowners to feel empowered to complete simple risk reduction activities on their property.

Table 21. Proximity to the Interface.⁴⁹

Proximity to the Interface	Descriptor*	Explanation
WUI 100 <i>HIZ/CIIZ and Community Zones</i>	(0-100 m)	This Zone is always located adjacent to the value at risk. Treatment would modify the wildfire behaviour near or adjacent to the value. Treatment effectiveness would be increased when the value is FireSmart.
WUI 500 <i>Community and Landscape Zones</i>	(100-500 m)	Treatment would affect wildfire behaviour approaching a value, as well as the wildfire's ability to impact the value with short- to medium- range spotting; should also provide suppression opportunities near a value.
WUI 2000 <i>Landscape Zone</i>	(500-1000 m)	Treatment would be effective in limiting long - range spotting but short-range spotting may fall short of the value and cause a new ignition that could affect a value.
<i>Landscape Zone</i>	> 1000 m	This should form part of a landscape assessment and is generally not part of the zoning process. Treatment is relatively ineffective for threat mitigation to a value, unless used to form a part of a larger fuel break / treatment.

*Distances are based on spotting distances of high and moderate fuel type spotting potential and threshold to break crown fire potential (100m). These distances can be varied with appropriate rationale, to address areas with low or extreme fuel hazards.
